

# Package ‘spatialFDA’

August 26, 2025

**Title** A Tool for Spatial Multi-sample Comparisons

**Version** 1.1.10

**URL** <https://github.com/mjemon/spatialFDA>

**BugReports** <https://github.com/mjemon/spatialFDA/issues>

**Description** spatialFDA is a package to calculate spatial statistics metrics.

The package takes a SpatialExperiment object and calculates spatial statistics metrics using the package spatstat.

Then it compares the resulting functions across samples/conditions using functional additive models as implemented in the package refund.

Furthermore, it provides exploratory visualisations using functional principal component analysis, as well implemented in refund.

**License** GPL (>= 3) + file LICENSE

**Encoding** UTF-8

**Depends** R (>= 4.3.0)

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Imports** dplyr, ggplot2, parallel, patchwork, purrr, refund,  
SpatialExperiment, spatstat.explore, spatstat.geom,  
SummarizedExperiment, tidyverse, methods, stats, fda, graphics,  
magrittr, ExperimentHub

**biocViews** Software, Spatial, Transcriptomics

**VignetteBuilder** knitr

**Suggests** stringr, knitr, rmarkdown, BiocStyle, testthat (>= 3.0.0),  
mgcv

**Config/testthat/edition** 3

**git\_url** <https://git.bioconductor.org/packages/spatialFDA>

**git\_branch** devel

**git\_last\_commit** de7274c

**git\_last\_commit\_date** 2025-08-22

**Repository** Bioconductor 3.22

**Date/Publication** 2025-08-25

<i>.dfToppp</i>	<i>Convert SpatialExperiment object to ppp object</i>
-----------------	---

---

### Description

Convert SpatialExperiment object to ppp object

### Usage

```
.dfToppp(df, marks = NULL, continuous = FALSE, window = NULL)
```

### Arguments

<i>df</i>	A datafram with the x and y coordinates from the corresponding SpatialExperiment and the ColData
<i>marks</i>	A vector of marks to be associated with the points, has to be either named 'cell_type' if you want to compare discrete celltypes or else continous gene expression measurements are assumed as marks.

continuous	A boolean indicating whether the marks are continuous defaults to FALSE
window	An observation window of the point pattern of class <code>owin</code> .

**Value**

A ppp object for use with `spatstat` functions

**Examples**

```
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
speSub <- subset(spe, , image_number == "138")
dfSub <- .speToDf(speSub)
pp <- .dfToppp(dfSub, marks = "cell_type")
```

---

**.extractMetric**

*Compute a spatial metric on a `SpatialExperiment` object*

---

**Description**

A function that takes a `SpatialExperiment` object and computes a spatial statistics function as implemented in `spatstat`. The output is a `spatstat` object.

**Usage**

```
.extractMetric(
  df,
  selection,
  fun,
  marks = NULL,
  rSeq = NULL,
  by = NULL,
  continuous = FALSE,
  window = NULL,
  ...
)
```

**Arguments**

df	A data frame with the x and y coordinates from the corresponding <code>SpatialExperiment</code> and the <code>colData</code>
selection	the mark(s) you want to compare
fun	the <code>spatstat</code> function to compute on the point pattern object
marks	the marks to consider e.g. cell types
rSeq	the range of r values to compute the function over
by	the <code>spe colData</code> variable(s) to add to the meta data
continuous	A boolean indicating whether the marks are continuous defaults to FALSE
window	a observation window for the point pattern of class <code>owin</code> .
...	Other parameters passed to <code>spatstat.explore</code> functions

**Value**

a spatstat metric object with the fov number, the number of points and the centroid of the image

**Examples**

```
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
speSub <- subset(spe, , image_number == "138")
dfSub <- .speToDf(speSub)
metricRes <- .extractMetric(dfSub, c("alpha", "beta"),
  fun = "Gcross",
  marks = "cell_type", rSeq = seq(0, 1000, length.out = 100),
  by = c("patient_stage", "patient_id", "image_number"))
)
```

**.loadExample**

*load Example dataset from Damond et al. (2019)*

**Description**

load Example dataset from Damond et al. (2019)

**Usage**

```
.loadExample(full = FALSE)
```

**Arguments**

<b>full</b>	a boolean indicating whether to load the entire Damond et al. (2019) or only a subset
-------------	---

**Value**

A SpatialExperiment object as uploaded to ExperimentHub()

**Examples**

```
# retrieve the Damond et al. (2019) dataset
spe <- .loadExample()
```

---

.speToDf	<i>Transform a SpatialExperiment into a dataframe</i>
----------	---

---

## Description

Transform a SpatialExperiment into a dataframe

## Usage

```
.speToDf(spe)
```

## Arguments

spe	A SpatialExperiment object subset to a single image
-----	---

## Value

A dataframe with the x and y coordinates from the corresponding SpatialExperiment and the col-  
Data

## Examples

```
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
speSub <- subset(spe, , image_number == "138")
dfSub <- .speToDf(speSub)
```

---

calcCrossMetricPerFov	<i>Calculate cross spatial metrics for all combinations per FOV</i>
-----------------------	---

---

## Description

A function that takes a SpatialExperiment object as input and calculates a cross spatial metric as implemented by spatstat per field of view for all combinations provided by the user.

## Usage

```
calcCrossMetricPerFov(
  spe,
  selection,
  subsetby = NULL,
  fun,
  marks = NULL,
  rSeq = NULL,
  by = NULL,
  ncores = 1,
  continuous = FALSE,
  assay = "exprs",
  ...
)
```

## Arguments

spe	a SpatialExperiment object
selection	the mark(s) you want to compare
subsetby	the spe colData variable to subset the data by
fun	the spatstat function to compute on the point pattern object
marks	the marks to consider e.g. cell types
rSeq	the range of r values to compute the function over
by	the spe colData variable(s) to add to the meta data
ncores	the number of cores to use for parallel processing, default = 1
continuous	A boolean indicating whether the marks are continuous defaults to FALSE
assay	the assay which is used if continuous = TRUE
...	Other parameters passed to spatstat.explore functions

## Value

a data frame of the spatstat metric objects with the radius r, the theoretical value of a Poisson process, the different border corrections the fov number, the number of points and the centroid of the image

## Examples

```
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
metricRes <- calcCrossMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), by = c(
    "patient_stage", "patient_id",
    "image_number"
  ),
  ncores = 1
)
```

## calcMetricPerFov

*Calculate a spatial metric on a SpatialExperiment object per field of view*

## Description

A function that takes a SpatialExperiment object as input and calculates a spatial metric as implemented by spatstat per field of view.

## Usage

```
calcMetricPerFov(
  spe,
  selection,
  subsetby,
  fun,
  marks = NULL,
  rSeq = NULL,
  by = NULL,
  continuous = FALSE,
  assay = "exprs",
  ncores = 1,
  ...
)
```

## Arguments

spe	a SpatialExperiment object
selection	the mark(s) you want to compare. NOTE: This is directional. c(A,B) is not the same result as c(B,A).
subsetby	the spe colData variable to subset the data by. This variable has to be provided, even if there is only one sample.
fun	the spatstat function to compute on the point pattern object
marks	the marks to consider e.g. cell types
rSeq	the range of r values to compute the function over
by	the spe colData variable(s) to add to the meta data
continuous	A boolean indicating whether the marks are continuous defaults to FALSE
assay	the assay which is used if continuous = TRUE
ncores	the number of cores to use for parallel processing, default = 1
...	Other parameters passed to spatstat.explore functions

## Value

a dataframe of the spatstat metric objects with the radius r, the theoretical value of a Poisson process, the different border corrections the fov number, the number of points and the centroid of the image

## Examples

```
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), by = c(
    "patient_stage", "patient_id",
    "image_number"
  ),
  ncores = 1
)
```

---

**crossSpatialInference** *Function for Cross Spatial Inference*

---

### Description

This function is a wrapper function around `spatialInference`. It calculates `spatialInference` results either for all cell types in `marks` (if `selection == NULL`) or for a custom subset defined in `selection`.

### Usage

```
crossSpatialInference(
  spe,
  selection = NULL,
  subsetby,
  fun,
  marks = NULL,
  rSeq = NULL,
  correction,
  sample_id,
  image_id,
  condition,
  continuous = FALSE,
  assay = "exprs",
  transformation = NULL,
  eps = NULL,
  delta = 0,
  family = stats::gaussian(link = "log"),
  ncores = 1,
  ...
)
```

### Arguments

<code>spe</code>	a <code>SpatialExperiment</code> object
<code>selection</code>	the mark(s) you want to compare. NOTE: This is directional. <code>c(A,B)</code> is not the same result as <code>c(B,A)</code> .
<code>subsetby</code>	the <code>spe</code> <code>colData</code> variable to subset the data by. This variable has to be provided, even if there is only one sample.
<code>fun</code>	the <code>spatstat</code> function to compute on the point pattern object
<code>marks</code>	the marks to consider e.g. cell types
<code>rSeq</code>	the range of <code>r</code> values to compute the function over
<code>correction</code>	the edge correction to be applied
<code>sample_id</code>	the <code>spe</code> <code>colData</code> variable to mark the sample, if not <code>NULL</code> this will result in a mixed model estimation
<code>image_id</code>	the <code>spe</code> <code>colData</code> variable to mark the image
<code>condition</code>	the <code>spe</code> <code>colData</code> variable to mark the condition
<code>continuous</code>	A boolean indicating whether the marks are continuous defaults to <code>FALSE</code>

assay	the assay which is used if continuous = TRUE
transformation	the transformation to be applied as exponential e.g. 1/2 for sqrt
eps	some distributional families fail if the response is zero, therefore, zeros can be replaced with a very small value eps
delta	the delta value to remove from the beginning of the spatial statistics functions. Can be reasonable if e.g. cells are always spaced by 10 µm.
family	the distributional family for the functional GAM
ncores	the number of cores to use for parallel processing, default = 1
...	Other parameters passed to spatstat.explore functions

### Value

a list of objects created by the function spatialInference with three objects: i) the dataframe with the spatial statistics results, ii) the designmatrix of the inference and iii) the fitted pffr object

### Examples

```

spe <- .loadExample()
#make the condition a factor variable
colData(spe)[["patient_stage"]] <- factor(colData(spe)[["patient_stage"]])
#relevel to have non-diabetic as the reference category
colData(spe)[["patient_stage"]] <- relevel(colData(spe)[["patient_stage"]],
"Non-diabetic")

selection <- c("acinar", "ductal")
resLs <- crossSpatialInference(spe, selection,
subsetby = "image_number", fun = "Gcross", marks = "cell_type",
rSeq = seq(0, 50, length.out = 50), correction = "rs",
sample_id = "patient_id",
image_id = "image_number", condition = "patient_stage",
ncores = 1
)

```

## extractCrossInferenceData

*Reshaping the Result of a Cross Spatial Inference to a Dataframe*

### Description

Reshaping the Result of a Cross Spatial Inference to a Dataframe

### Usage

```
extractCrossInferenceData(resLs)
```

### Arguments

resLs	a list of objects created by the function spatialInference with three objects: i) the dataframe with the spatial statistics results, ii) the designmatrix of the inference and iii) the fitted pffr object
-------	--

**Value**

a dataframe for plotting with ggplot2

**Examples**

```

spe <- .loadExample()
#make the condition a factor variable
colData(spe)[["patient_stage"]] <- factor(colData(spe)[["patient_stage"]])
#relevel to have non-diabetic as the reference category
colData(spe)[["patient_stage"]] <- relevel(colData(spe)[["patient_stage"]],
"Non-diabetic")

selection <- c("acinar", "ductal")
resLs <- crossSpatialInference(spe, selection,
                               subsetby = "image_number", fun = "Gcross", marks = "cell_type",
                               rSeq = seq(0, 50, length.out = 50), correction = "rs",
                               sample_id = "patient_id",
                               image_id = "image_number", condition = "patient_stage",
                               ncores = 1
)
df <- extractCrossInferenceData(resLs)

```

**Description**

A function that takes the output of a metric calculation as done by calcMetricPerFov. The data has to be prepared into the correct format for the functional analysis by the prepData function. The output is a pffr object as implemented by refund.

**Usage**

```
functionalGam(
  data,
  x,
  designmat,
  weights,
  formula,
  family = stats::gaussian(link = "log"),
  ...
)
```

**Arguments**

<b>data</b>	a dataframe with the following columns: Y = functional response; sample_id = sample ID; image_id = image ID;
<b>x</b>	the x-axis values of the functional response
<b>designmat</b>	a design matrix as defined by model.matrix()
<b>weights</b>	weights as the number of points per image. These weights are normalised by the mean of the weights in the fitting process

formula	the formula for the model. The colnames of the designmatrix have to correspond to the variables in the formula.
family	the distributional family as implemented in <code>family.mgcv</code> . For fast computation the default is set to <code>gaussian</code> with a log link. other interesting options can be <code>betar</code> and <code>scat</code>
...	<ul style="list-style-type: none"> <li>• for more information see <code>family.mgcv</code>.</li> </ul> <p>Other parameters passed to <code>pffr</code></p>

**Value**

a fitted `pffr` object which inherits from `gam`

**Examples**

```
# load the pancreas dataset
library("tidyverse")
library("dplyr")
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
# calculate the Gcross metric for alpha and beta cells
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross",
  marks = "cell_type", rSeq = seq(0, 50, length.out = 50),
  c("patient_stage", "patient_id", "image_number"), ncores = 1
)
metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id,
  "|", metricRes$image_number
)
dat <- prepData(metricRes, "r", "rs", sample_id = "patient_id",
  image_id = "image_number", condition = "patient_stage")

#' # drop rows with NA
dat <- dat |> drop_na()

# create a designmatrix
condition <- dat$patient_stage
# relevel the condition - can set explicit contrasts here
condition <- relevel(condition, "Non-diabetic")
designmat <- model.matrix(~condition)
# colnames don't work with the '-' sign
colnames(designmat) <- c(
  "(Intercept)", "conditionLong_duration",
  "conditionOnset"
)
# fit the model
mdl <- functionalGam(
  data = dat, x = metricRes$r |> unique(),
  designmat = designmat, weights = dat$npoints,
  formula = formula(Y ~ conditionLong_duration +
    conditionOnset + s(patient_id, bs = "re"))
)
summary(mdl)
```

## Description

A function that takes as input the output of `calcMetricPerFov` which has to be converted into the correct format by `prepData`. The output is a list with the `fpcा. face` output from `refund`.

## Usage

```
functionalPCA(data, r, ...)
```

## Arguments

<code>data</code>	a data object for functional data analysis containing at least the functional response <code>\$Y\$</code> .
<code>r</code>	the functional domain
<code>...</code>	Other parameters passed to <code>fpcा. sc</code> functions

## Value

a list with components of `fpcा. sc`

## Examples

```
# load the pancreas dataset
library("tidyR")
library("stringr")
library("dplyr")
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
# calculate the Gcross metric for alpha and beta cells
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross",
  marks = "cell_type", rSeq = seq(0, 50, length.out = 50),
  c("patient_stage", "patient_id", "image_number"), ncores = 1
)
metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id,
  "|", metricRes$image_number
)
# prepare data for FDA
dat <- prepData(metricRes, "r", "rs")

# drop rows with NA
dat <- dat |> drop_na()
# create meta info of the IDs
splitData <- str_split(dat$ID, "x")
dat$condition <- factor(sapply(splitData, function(x) x[1]))
dat$patient_id <- factor(sapply(splitData, function(x) x[2]))
dat$image_id <- factor(sapply(splitData, function(x) x[3]))
# calculate fPCA
mdl <- functionalPCA(
```

```
  data = dat, r = metricRes$r |> unique()
)
```

**plotCrossFOV***Creates a nXn plot of the cross metrics per sample***Description**

Helper function for `plotCrossMetricPerFov`. It applies `plotMetricPerFov` to all n marks defined in the variable selection. This gives an nxn plot of all marks.

**Usage**

```
plotCrossFOV(
  subFov,
  theo,
  correction,
  x,
  imageId,
  ID = NULL,
  ncol = NULL,
  nrow = NULL,
  legend.position = "none",
  ...
)
```

**Arguments**

<code>subFov</code>	a subset of the data frame to the respective fov
<code>theo</code>	logical; if the theoretical line should be plotted
<code>correction</code>	the border correction to plot
<code>x</code>	the x-axis variable to plot
<code>imageId</code>	the ID of the image/fov
<code>ID</code>	the (optional) ID for plotting combinations
<code>ncol</code>	the number of columns for the facet wrap
<code>nrow</code>	the number of rows for the facet wrap
<code>legend.position</code>	the position of the legend of the plot
<code>...</code>	Other parameters passed to ggplot2 functions

**Value**

a ggplot object

**plotCrossHeatmap**      *Plotting the Result of a Cross Spatial Inference*

## Description

Plotting the Result of a Cross Spatial Inference

## Usage

```
plotCrossHeatmap(resLs, adj.pvalue = "BH", coefficientsToPlot = NULL, ...)
```

## Arguments

<code>resLs</code>	a list of objects created by the function <code>spatialInference</code> with three objects: i) the dataframe with the spatial statistics results, ii) the designmatrix of the inference and iii) the fitted pffr object
<code>adj.pvalue</code>	a pvalue adjustment method as passed to <code>stats::p.adjust</code> defaults to Benjamini-Hochberg correction of the false discovery rate.
<code>coefficientsToPlot</code>	list of which coefficients to plot in the heatmap defaults to <code>NULL</code> in which case all coefficients are plotted
<code>...</code>	other parameters passed to <code>ggplot2</code> functions

## Value

a `ggplot2` object

## Examples

```
spe <- .loadExample()
#make the condition a factor variable
colData(spe)[["patient_stage"]] <- factor(colData(spe)[["patient_stage"]])
#relevel to have non-diabetic as the reference category
colData(spe)[["patient_stage"]] <- relevel(colData(spe)[["patient_stage"]],
"Non-diabetic")

selection <- c("acinar", "ductal")
resLs <- crossSpatialInference(spe, selection,
                               subsetby = "image_number", fun = "Gcross", marks = "cell_type",
                               rSeq = seq(0, 50, length.out = 50), correction = "rs",
                               sample_id = "patient_id",
                               image_id = "image_number", condition = "patient_stage",
                               ncores = 1
)
p <- plotCrossHeatmap(resLs, adj.pvalue = "BH")
```

---

`plotCrossMetricPerFov` *Plot a cross type spatial metric per field of view*

---

## Description

This function plots the cross function between two marks output from `calcMetricPerFov`. It wraps around helper function and applies this function to all samples.

## Usage

```
plotCrossMetricPerFov(
  metricDf,
  theo = NULL,
  correction = NULL,
  x = NULL,
  imageId = NULL,
  ID = NULL,
  nrow = NULL,
  ncol = NULL,
  legend.position = "none",
  ...
)
```

## Arguments

<code>metricDf</code>	the metric dataframe as calculated by <code>calcMetricPerFov</code>
<code>theo</code>	logical; if the theoretical line should be plotted
<code>correction</code>	the border correction to plot
<code>x</code>	the x-axis variable to plot
<code>imageId</code>	the ID of the image/fov
<code>ID</code>	the (optional) ID for plotting combinations
<code>nrow</code>	the number of rows for the facet wrap
<code>ncol</code>	the number of columns for the facet wrap
<code>legend.position</code>	the position of the legend of the plot
<code>...</code>	Other parameters passed to ggplot2 functions

## Value

a ggplot object

## Examples

```
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
metricRes <- calcCrossMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), by = c(
    "patient_stage", "patient_id",
```

```

    "image_number"
),
ncores = 1
)

metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id
)

metricRes <- subset(metricRes, image_number %in% c(138, 139, 140))
p <- plotCrossMetricPerFov(metricRes,
  theo = TRUE, correction = "rs",
  x = "r", imageId = "image_number", ID = "ID"
)
print(p)

```

**plotFbPlot***Functional boxplot of spatstat curves***Description**

This function creates a functional boxplot of the spatial statistics curves. It creates one functional boxplot per aggregation category, e.g. condition.

**Usage**

```
plotFbPlot(metricDf, x, y, aggregateBy)
```

**Arguments**

<code>metricDf</code>	the metric dataframe as calculated by <code>calcMetricPerFov</code>
<code>x</code>	the name of the x-axis of the spatial metric
<code>y</code>	the name of the y-axis of the spatial metric
<code>aggregateBy</code>	the criterion by which to aggregate the curves into a functional boxplot. Can be e.g. the condition of the different samples.

**Value**

a list of base R plots

**Examples**

```

# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), by = c(
    "patient_stage", "patient_id",
    "image_number"
),
ncores = 1
)
# create a unique ID for the data preparation

```

```

metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id,
  "|", metricRes$image_number
)

plotFbPlot(metricRes, 'r', 'rs', 'patient_stage')

```

**plotFpca***Plot a biplot from an fPCA analysis***Description**

A function that takes the output from the `functionalPCA` function and returns a `ggplot` object of the first two dimensions of the PCA as biplot.

**Usage**

```
plotFpca(data, res, colourby = NULL, labelby = NULL)
```

**Arguments**

<code>data</code>	a data object for functional data analysis containing at least the functional response <code>\$Y\$</code> .
<code>res</code>	the output from the fPCA calculation
<code>colourby</code>	the variable by which to colour the PCA plot by
<code>labelby</code>	the variable by which to label the PCA plot by

**Value**

a list with components of `fpcfa.face`

**Examples**

```

# load the pancreas dataset
library("tidyverse")
library("stringr")
library("dplyr")
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
# calculate the Gcross metric for alpha and beta cells
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross",
  marks = "cell_type", rSeq = seq(0, 50, length.out = 50),
  c("patient_stage", "patient_id", "image_number"), ncores = 1
)
metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id,
  "|", metricRes$image_number
)

# prepare data for FDA
dat <- prepData(metricRes, "r", "rs")

```

```

**plotMdl***Plot a pffr model object***Description**

A function that takes a pffr object as calculated in `functionalGam` and plots the functional coefficients. The functions are centered such that their expected value is zero. Therefore, the scalar intercept has to be added to the output with the argument `shift` in order to plot the coefficients in their original range.

**Usage**

```
plotMdl(mdl, predictor, shift = NULL)
```

**Arguments**

<code>mdl</code>	a pffr model object
<code>predictor</code>	predictor to plot
<code>shift</code>	the value by which to shift the centered functional intercept. this will most often be the constant intercept

**Value**

ggplot object of the functional estimate

**Examples**

```

library("tidyverse")
library("stringr")
library("dplyr")
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), by = c(
    "patient_stage", "patient_id",

```

```

    "image_number"
),
ncores = 1
)
# create a unique ID for each row
metricRes$ID <- paste0(
  metricRes$patient_stage, "x", metricRes$patient_id,
  "x", metricRes$image_number
)

dat <- prepData(metricRes, "r", "rs", sample_id = "patient_id",
  image_id = "image_number", condition = "patient_stage")

#' # drop rows with NA
dat <- dat |> drop_na()

# create a designmatrix
condition <- dat$patient_stage
# relevel the condition - can set explicit contrasts here
condition <- relevel(condition, "Non-diabetic")
designmat <- model.matrix(~condition)
# colnames don't work with the '-' sign
colnames(designmat) <- c(
  "(Intercept)", "conditionLong_duration",
  "conditionOnset"
)
# fit the model
mdl <- functionalGam(
  data = dat, x = metricRes$r |> unique(),
  designmat = designmat, weights = dat$npoints,
  formula = formula(Y ~ conditionLong_duration +
    conditionOnset + s(patient_id, bs = "re"))
)
summary(mdl)
plotLs <- lapply(colnames(designmat), plotMdl,
  mdl = mdl,
  shift = mdl$coefficients[["(Intercept)"]]
)

```

**plotMetricPerFov**      *Plot a spatial metric per field of view*

## Description

A function that plots the output of the function calcMetricPerFov. The plot contains one curve per FOV and makes subplots by samples.

## Usage

```
plotMetricPerFov(
  metricDf,
  theo = FALSE,
  correction = NULL,
  x = NULL,
```

```

imageId = NULL,
ID = NULL,
nrow = NULL,
ncol = NULL,
legend.position = "none",
...
)

```

### Arguments

<code>metricDf</code>	the metric dataframe as calculated by <code>calcMetricPerFov</code>
<code>theo</code>	logical; if the theoretical line should be plotted
<code>correction</code>	the border correction to plot
<code>x</code>	the x-axis variable to plot
<code>imageId</code>	the ID of the image/fov
<code>ID</code>	the (optional) ID for plotting combinations
<code>nrow</code>	the number of rows for the facet wrap
<code>ncol</code>	the number of columns for the facet wrap
<code>legend.position</code>	the position of the legend of the plot
<code>...</code>	Other parameters passed to ggplot2 functions

### Value

a ggplot object

### Examples

```

# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), by = c(
    "patient_stage", "patient_id",
    "image_number"
  ),
  ncores = 1
)
# ceate a unique plotting ID
metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id
)

p <- plotMetricPerFov(metricRes,
  correction = "rs", x = "r",
  imageId = "image_number", ID = "ID"
)
print(p)

```

---

prepData	<i>Prepare data from calcMetricRes to be in the right format for FDA</i>
----------	--

---

**Description**

Prepare data from calcMetricRes to be in the right format for FDA

**Usage**

```
prepData(metricRes, x, y, sample_id = NULL, image_id = NULL, condition = NULL)
```

**Arguments**

metricRes	a datafram as calculated by calcMetricRes - requires the columns ID (unique identifier of each row)
x	the name of the x-axis of the spatial metric
y	the name of the y-axis of the spatial metric
sample_id	the spe colData variable to mark the sample
image_id	the spe colData variable to mark the image
condition	the spe colData variable to mark the condition

**Value**

returns a list with three entries, the unique ID, the functional response Y and the weights

**Examples**

```
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), by = c(
    "patient_stage", "patient_id",
    "image_number"
  ),
  ncores = 1
)

# create a unique ID for each row
metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id,
  "|", metricRes$image_number
)
dat <- prepData(metricRes, "r", "rs", sample_id = "patient_id",
  image_id = "image_number", condition = "patient_stage")
```

---

print.fPCA	<i>print the fPCA results</i>
------------	-------------------------------

---

## Description

this is a function that prints a summary of the fPCA result of class `fPCA`

## Usage

```
## S3 method for class 'fPCA'
print(x, ...)
```

## Arguments

<code>x</code>	the result of function <code>functionalPCA</code>
<code>...</code>	other parameters passed to base generic function <code>print</code>

## Value

a formatted overview of the fPCA result

## Examples

```
# load the pancreas dataset
library("tidyverse")
library("stringr")
library("dplyr")
# retrieve example data from Damond et al. (2019)
spe <- .loadExample()
# calculate the Gcross metric for alpha and beta cells
metricRes <- calcMetricPerFov(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross",
  marks = "cell_type", rSeq = seq(0, 50, length.out = 50),
  c("patient_stage", "patient_id", "image_number"), ncores = 1
)
metricRes$ID <- paste0(
  metricRes$patient_stage, "|", metricRes$patient_id,
  "|", metricRes$image_number
)
# prepare data for FDA
dat <- prepData(metricRes, "r", "rs")

# drop rows with NA
dat <- dat |> drop_na()

# create meta info of the IDs
splitData <- strsplit(dat$ID, "|", fixed = TRUE)
dat$condition <- factor(sapply(splitData, function(x) x[1]))
dat$patient_id <- factor(sapply(splitData, function(x) x[2]))
dat$image_id <- factor(sapply(splitData, function(x) x[3]))
# calculate fPCA
mdl <- functionalPCA(
  data = dat, r = metricRes$r |> unique()
)
```

```
mdl
```

## Description

A function to perform spatial statistical inference on spatial omics data. This function works so far only on functions of radius "r".

## Usage

```
spatialInference(
  spe,
  selection,
  subsetby,
  fun,
  marks = NULL,
  rSeq = NULL,
  correction,
  sample_id,
  image_id,
  condition,
  continuous = FALSE,
  assay = "exprs",
  transformation = NULL,
  eps = NULL,
  delta = 0,
  family = stats::gaussian(link = "log"),
  ncores = 1,
  ...
)
```

## Arguments

spe	a <code>SpatialExperiment</code> object
selection	the mark(s) you want to compare. NOTE: This is directional. <code>c(A,B)</code> is not the same result as <code>c(B,A)</code> .
subsetby	the spe <code>colData</code> variable to subset the data by. This variable has to be provided, even if there is only one sample.
fun	the <code>spatstat</code> function to compute on the point pattern object
marks	the marks to consider e.g. cell types
rSeq	the range of r values to compute the function over
correction	the edge correction to be applied
sample_id	the spe <code>colData</code> variable to mark the sample, if not NULL this will result in a mixed model estimation
image_id	the spe <code>colData</code> variable to mark the image
condition	the spe <code>colData</code> variable to mark the condition

<code>continuous</code>	A boolean indicating whether the marks are continuous defaults to FALSE
<code>assay</code>	the assay which is used if <code>continuous</code> = TRUE
<code>transformation</code>	the transformation to be applied as exponential e.g. 1/2 for sqrt or Fisher's variance-stabilising transformation if "Fisher"
<code>eps</code>	some distributional families fail if the response is zero, therefore, zeros can be replaced with a very small value <code>eps</code>
<code>delta</code>	the delta value to remove from the beginning of the spatial statistics functions. Can be reasonable if e.g. cells are always spaced by 10 $\mu\text{m}$ .
<code>family</code>	the distributional family for the functional GAM
<code>ncores</code>	the number of cores to use for parallel processing, default = 1
<code>...</code>	Other parameters passed to <code>spatstat.explore</code> functions

### Value

a list with three objects: i) the dataframe with the spatial statistics results, ii) the designmatrix of the inference and iii) the fitted pffr object

### Examples

```

spe <- .loadExample()
#make the condition a factor variable
colData(spe)[["patient_stage"]] <- factor(colData(spe)[["patient_stage"]])
#relevel to have non-diabetic as the reference category
colData(spe)[["patient_stage"]] <- relevel(colData(spe)[["patient_stage"]],
"Non-diabetic")
res <- spatialInference(spe, c("alpha", "beta"),
  subsetby = "image_number", fun = "Gcross", marks = "cell_type",
  rSeq = seq(0, 50, length.out = 50), correction = "rs",
  sample_id = "patient_id",
  image_id = "image_number", condition = "patient_stage",
  ncores = 1
)

```
