

# Package ‘epivizrServer’

October 17, 2024

**Type** Package

**Title** WebSocket server infrastructure for epivizr apps and packages

**Version** 1.32.0

**URL** <https://epiviz.github.io>

**BugReports** <https://github.com/epiviz/epivizrServer>

**Description** This package provides objects to manage WebSocket connections to epiviz apps. Other epivizr package use this infrastructure.

**biocViews** Infrastructure, Visualization

**VignetteBuilder** knitr

**Depends** R (>= 3.2.3), methods

**Imports** httpuv (>= 1.3.0), R6 (>= 2.0.0), rjson, mime (>= 0.2)

**Suggests** testthat, knitr, rmarkdown, BiocStyle

**License** MIT + file LICENSE

**LazyData** true

**Collate** 'IndexedArray-class.R' 'Queue-class.R' 'utils.R' 'zzz.R'  
'middleware-plus-supporting.R' 'dummyTestPage.R'  
'EpivizServer-class.R' 'createServer.R'

**RoxygenNote** 7.1.0

**NeedsCompilation** no

**Author** Hector Corrada Bravo [aut, cre]

**Maintainer** Hector Corrada Bravo <hcorrada@gmail.com>

**git\_url** <https://git.bioconductor.org/packages/epivizrServer>

**git\_branch** RELEASE\_3\_19

**git\_last\_commit** d436410

**git\_last\_commit\_date** 2024-04-30

**Repository** Bioconductor 3.19

**Date/Publication** 2024-10-16

<code>createServer</code>	<i>Create a new EpivizServer object</i>
---------------------------	---

---

### Description

Create a new `EpivizServer` object

### Usage

```
createServer(
  port = 7123L,
  static_site_path = "",
  try_ports = FALSE,
  daemonized = NULL,
  verbose = FALSE,
  non_interactive = FALSE
)
```

### Arguments

<code>port</code>	(int) port to which server will listen to.
<code>static_site_path</code>	(character) path to serve static html files.
<code>try_ports</code>	(logical) try various ports until an open port is found.
<code>daemonized</code>	(logical) run in background using httpuv's daemonized libuv server.
<code>verbose</code>	(logical) print verbose output.
<code>non_interactive</code>	(logical) run in non-interactive mode. For development purposes only.

### Value

an `EpivizServer` object

### See Also

[EpivizServer](#) for the class of objects returned

## Examples

```
server <- createServer(port=7123,  
                      verbose=TRUE  
)
```

---

EpivizServer-class	<i>Class providing WebSocket connection server</i>
--------------------	--

---

## Description

Class providing WebSocket connection server

## Details

The most important aspect of the API of this server are methods `register_action` and `send_request`. These are used to interact with the epiviz JS app through the provided websocket connection. `register_action(action, callback)` registers a callback function to be executed upon request from the epiviz JS app. When the server receives a JSON message through the websocket, it checks for an action field in the received request message, and then evaluates the expression `callback(message_data)` where `message_data` is obtained from the data field in the received message. A response will be sent to the epiviz app with field `data` populated with the result of the callback. If an error occurs during evaluation of the callback function, the response will be sent with field `success` set to `false`.

To send requests to the JS app, method `send_request(request_data, callback)` should be used. This sends a request to the JS app with the `data` field populated with argument `request_data`. Once a response is received (with field `success` equal to `true`) the expression `callback(response_data)` is evaluated where `response_data` is obtained from the `data` field in the received response message.

## Value

RC object with methods for communication with epiviz JS app

## Methods

`has_action(action)` Check if a callback is registered for given action<character>, <logical>. (See Details)

`has_request_waiting()` Check if there is a sent request waiting for a response from JS app, <logical>

`is_closed()` Check if server is closed, <logical>

`is_daemonized()` Check if server is running in background, <logical>

`is_interactive()` Check if server is running in interactive mode, <logical>

`is_socket_connected()` Check if there is an open websocket connection to JS app, <logical>

`register_action(action, callback)` Register a callback<function> to evaluate when epiviz JS sends a request for given action<character>. (See Details)

**run\_server(...)** Run server in blocking mode  
**send\_request(request\_data, callback)** Send request to epiviz JS app with given request\_data<list>, and evaluate callback<function> when response arrives. (See Details)  
**service()** Listen to requests from server. Only has effect when non-daemonized  
**start\_server()** Start the underlying httpuv server, daemonized if applicable  
**stop\_server()** Stop the underlying httpuv server  
**stop\_service()** Stop listening to requests from server. Only has effect when non-daemonized.  
**unregister\_action(action)** Unregister a callback function for given action<character> (if registered). (See Details)  
**wait\_to\_clear\_requests(timeout = 3L)** Wait for timeout seconds to clear all pending requests.

## Examples

```

server <- createServer()
server$register_action("getData", function(request_data) {
  list(x=1,y=3)
})

server$start_server()

server$send_request(list(x=2,y=5), function(response_data) {
  cat(response_data$x)
})

server$stop_server()

```

IndexedArray-class      *Class providing an indexed array (hashtable)*

## Description

Class providing an indexed array (hashtable)

## Methods

**append(item)** Append item to tail of array, returns id of item <int>  
**empty()** Remove all items from array  
**get(id)** Get item with given id<int>, returns <ANY>, returns NULL if no item with given id  
**length()** Return number of items on array <int>

---

json_parser	<i>JSON parser used by this package</i>
-------------	---

---

## Description

Currently this just renames [fromJSON](#) in the rjson package.

## Usage

```
json_parser(  
  json_str,  
  file,  
  method = "C",  
  unexpected.escape = "error",  
  simplify = TRUE  
)
```

## Arguments

json_str	json string to parse
file	file to read json_Str from
method	method used to parse json
unexpected.escape	handling escape characters, one of error, skip, keep
simplify	if TRUE, convert json-encoded lists to vectors

## Value

a JSON object

## See Also

[fromJSON](#)

---

json_writer	<i>JSON writer used by this package</i>
-------------	---

---

## Description

Currently this just renames [toJSON](#) in the rjson package.

## Usage

```
json_writer(x, indent = 0, method = "C")
```

**Arguments**

x	object to write to json
indent	integer specifying how much indentation to use when formatting the JSON object; if 0, no pretty-formatting is used
method	method used to write json

**Value**

a string with JSON encoding of object

**See Also**

[toJSON](#)

---

Queue-class

*Class providing a queue data structure*

---

**Description**

Class providing a queue data structure

**Methods**

- empty() Remove all items from queue
- has\_more() Return TRUE if there are more items in queue <logical>
- length() Return the number of items in queue <int>
- pop() Pop next item from queue (returns NULL if queue is empty)
- push(item) Push <item> onto queue
