

# Package ‘scLink’

October 14, 2022

**Title** Inferring Functional Gene Co-Expression Networks from Single Cell Data

**Version** 1.0.1

**Description** Uses statistical network modeling to understand the co-expression relationships among genes and to construct sparse gene co-expression networks from single-cell gene expression data.

**License** GPL-3

**Depends** R (>= 3.5.0), parallel, glasso

**Suggests** knitr, rmarkdown

**VignetteBuilder** knitr

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.0.2

**NeedsCompilation** no

**Author** Wei Vivian Li [aut, cre] (<<https://orcid.org/0000-0002-2087-2709>>)

**Maintainer** Wei Vivian Li <vivian.li@rutgers.edu>

**Repository** CRAN

**Date/Publication** 2020-08-26 14:20:02 UTC

## Index

5

---

<b>sclink_cor</b>	<i>Calculate scLink's correlation matrix</i>
-------------------	--

---

## Description

Calculate scLink's correlation matrix

## Usage

```
sclink_cor(expr, ncores, nthre = 20, dthre = 0.9)
```

## Arguments

<code>expr</code>	A gene expression matrix with rows representing cells and columns representing genes. Gene names are given as column names. Can be the output of <code>sclink_norm</code> or user constructed gene expression matrices.
<code>ncores</code>	Number of cores if using parallel computation.
<code>nthre</code>	An integer specifying a threshold on the number of complete observations. Defaults to 20.
<code>dthre</code>	A number specifying the threshold on dropout probabilities. Defaults to 0.9.

## Value

A correlation matrix for gene co-expression relationships.

## Author(s)

Wei Vivian Li, <vivian.li@rutgers.edu>

## Examples

```
count = readRDS(system.file("extdata", "example.rds", package = "scLink"))
count.norm = sclink_norm(count, scale.factor = 1e6, filter.genes = TRUE, n = 500)
corr = sclink_cor(expr = count.norm, ncores = 1)
```

---

sclink_net	<i>Infer gene co-expression networks</i>
------------	--

---

## Description

Infer gene co-expression networks

## Usage

```
sclink_net(expr, ncores, lda = seq(1, 0.1, -0.05), nthre = 20, dthre = 0.9)
```

## Arguments

expr	A gene expression matrix with rows representing cells and columns representing genes. Gene names are given as column names. Can be the output of <code>sclink_norm</code> or user constructed gene expression matrices.
ncores	Number of cores if using parallel computation.
lda	A vector specifying a sequence of lambda values to be used in the penalized likelihood.
nthre	An integer specifying a threshold on the number of complete observations. Defaults to 20.
dthre	A number specifying the threshold on dropout probabilities. Defaults to 0.9.

## Value

A list for gene co-expression relationships. The list contains a `cor` element for scLink's correlation matrix and a `summary` element for the gene networks. `summary` is a list with each element corresponding to the result of one lambda value. Each element of `summary` contains the following information:

- adj:** the adjacency matrix specifying the gene-gene edges;
- Sigma:** the estimated concentration matrix;
- nedge:** number of edges in the gene network;
- bic:** BIC score;
- lambda:** value of lambda in the penalty.

## Author(s)

Wei Vivian Li, <[vivian.li@rutgers.edu](mailto:vivian.li@rutgers.edu)>

## Examples

```
count = readRDS(system.file("extdata", "example.rds", package = "scLink"))
count.norm = sclink_norm(count, scale.factor = 1e6, filter.genes = TRUE, n = 500)
networks = sclink_net(expr = count.norm, ncores = 1, lda = seq(0.5, 0.1, -0.05))
```

**sclink\_norm** *Pre-process data for scLink*

## Description

Pre-process data for scLink

## Usage

```
sclink_norm(
  count,
  scale.factor = 1e+06,
  filter.genes = FALSE,
  gene.names = NULL,
  n = 500
)
```

## Arguments

<code>count</code>	A full gene count matrix with rows representing cells and columns representing genes. Gene names are given as column names.
<code>scale.factor</code>	A number specifying the scale factor used for library size normalization. Defaults to 1e6.
<code>filter.genes</code>	A Boolean specifying whether scLink should select genes based on mean expression. When set to FALSE, users need to specify a set of genes to be used for network construction with <code>gene.names</code> . When set to TRUE, scLink will select genes based on their mean expression, and users need to specify the number of genes to be selected with <code>n</code> .
<code>gene.names</code>	A character vector specifying the genes used for network construction. Only needed when <code>filter.genes</code> = FALSE.
<code>n</code>	An integer specifying the number of genes to be selected by scLink (defaults to 500). Only needed when <code>filter.genes</code> = TRUE.

## Value

A transformed and normalized gene expression matrix that can be used for correlation calculation and network construction.

## Author(s)

Wei Vivian Li, <vivian.li@rutgers.edu>

## Examples

```
count = readRDS(system.file("extdata", "example.rds", package = "scLink"))
count.norm = sclink_norm(count, scale.factor = 1e6, filter.genes = TRUE, n = 500)
```
