

# Package ‘REMixed’

January 19, 2026

**Type** Package

**Title** Regularized Estimation in Mixed Effects Model

**Version** 1.1.2

**Maintainer** Auriane Gabaut <aurianegabaut@gmail.com>

## Description

Implementation of an algorithm in two steps to estimate parameters of a model whose latent dynamics are inferred through latent processes, jointly regularized. This package uses 'Monolix' software (<<https://monolixsuite.slp-software.com/>>), which provide robust statistical method for non-linear mixed effects modeling. 'Monolix' must have been installed prior to use.

**SystemRequirements** 'Monolix'

(<<https://monolixsuite.slp-software.com/>>)

**License** GPL (>= 3)

**Encoding** UTF-8

**LazyData** true

**Imports** deSolve, Rsmlx, doSNOW, dplyr, fastGHQuad, ggplot2, snow, stringr, Rmpfr

**RoxygenNote** 7.3.2

**Depends** R (>= 3.5.0), foreach

**NeedsCompilation** no

**Author** Auriane Gabaut [aut, cre],

Ariane Bercu [aut],

Mélanie Prague [aut],

Cécile Proust-Lima [aut]

**Repository** CRAN

**Date/Publication** 2026-01-19 15:30:02 UTC

| AIC.remix | <i>AIC for remix object</i> |
|-----------|-----------------------------|

---

## Description

Computes akaike information criterion from the output of `remix` as

$$AIC = -2\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha}) + k \times P$$

where  $P$  is the total number of parameters estimated and  $\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha})$  the log-likelihood of the model.

## Usage

```
## S3 method for class 'remix'
AIC(object, ..., k)
```

## Arguments

|        |  |
|--------|--|
| object | output of <code>remix</code> .   |
| ...    | additional arguments.  |
| k      | numeric, the penalty per parameter to be used; the default $k = 2$ is the classical AIC. |

**Value**

AIC.

**References**

            y = y,
            ObsModel.transfo = ObsModel.transfo,
            alpha = alpha,
            selfInit = TRUE,
            eps1=10**(-2),
            eps2=1,
            lambda=lambda)

AIC(res)

## End(Not run)
```

BIC.remix

*BIC for remix object***Description**

Computes bayesian information criterion from the output of [remix](#) as

$$BIC = -2\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha}) + \log(N)P$$

where  $P$  is the total number of parameters estimated,  $N$  the number of subject and  $\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha})$  the log-likelihood of the model.

**Usage**

```
## S3 method for class 'remix'
BIC(object, ...)
```

**Arguments**

```
object      output of remix.
...         additional arguments.
```

**Value**

BIC.

**References**

|      |             |
|------|-------------|
| BICc | <i>BICc</i> |
|------|-------------|

---

### Description

Computes corrected bayesian information criterion as

$$BICc = -2\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha}) + P_R \log(N) + P_F \log(n_{tot})$$

where  $P_F$  is the total number of parameters linked to fixed effects,  $P_R$  to random effects,  $N$  the number of subject,  $n_{tot}$  the total number of observations and  $\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha})$  the log-likelihood of the model.

### Usage

```
BICc(object, ...)
```

### Arguments

|        |   |
|--------|---|
| object | output of <a href="#">remix</a> or <a href="#">cv.remix</a> |
| ...    | optional additional arguments.                              |

### Value

BICc.

### References

        selfInit = TRUE,
        eps1=10**(-2),
        eps2=1,
        lambda=lambda)

BICc(res)

## End(Not run)

```

---

computeFinalTest      *Compute final estimation*

---

### Description

Computes a final saem and wald test if ‘test’ on the final model found by remix algorithm.

### Usage

```

computeFinalTest(
  remix.output,
  dynFUN,
  y,
  ObsModel.transfo,
  final.project = NULL,
  pop.set = NULL,
  prune = NULL,
  n = NULL,
  parallel = TRUE,
  ncores = NULL,
  print = TRUE,
  digits = 3,
  trueValue = NULL,
  test = TRUE,
  p.max = 0.05
)

```

### Arguments

|              |  |
|--------------|--|
| remix.output | a <a href="#">remix</a> outputs. It’s important that the project path of this outputs is still existing.   |
| dynFUN       | function computing the dynamics of interest for a set of parameters. This function need to contain every sub-function that it may needs (as it is called in a foreach loop). The output of this function need to return a data.frame with time as first columns and named dynamics in other columns. It must take in input : |

- `y` a named vector with the initial condition. The names are the dynamics names.
- `parms` a named vector of parameter.
- `time` vector a timepoint.

See [dynFUN\\_demo](#), [model.clairon](#), [model.pasin](#) or [model.pk](#) for examples.

|                               |  |
|-------------------------------|--|
| <code>y</code>                | initial condition of the mechanism model, conform to what is asked in dynFUN.  |
| <code>ObsModel.transfo</code> | <p>list containing two lists of transformations and two vectors linking each transformations to their observation model name in the Monolix project. The list should include identity transformations and be named <code>S</code> and <code>R</code>. The two vectors should be named <code>linkS</code> and <code>linkR</code>.</p> <p>Both <code>S</code> (for the direct observation models) and <code>linkS</code>, as well as <code>R</code> (for latent process models) and <code>linkR</code>, must have the same length.</p> <ul style="list-style-type: none"> <li>• <code>S</code>: a list of transformations for the direct observation models. Each transformation corresponds to a variable <math>Y_p = h_p(S_p)</math>, where the name indicates which dynamic is observed (from dynFUN);</li> <li>• <code>linkS</code>: a vector specifying the observation model names (that is used in the monolix project, <code>alpha1</code>, etc.) for each transformation, in the same order as in <code>S</code>;</li> <li>• <code>R</code>: similarly, a list of transformations for the latent process models. Although currently there is only one latent dynamic, each <math>s_k, k \leq K</math> transformation corresponds to the same dynamic but may vary for each <math>Y_k</math> observed. The names should match the output from dynFUN;</li> <li>• <code>linkR</code>: a vector specifying the observation model names for each transformation, in the same order as in <code>R</code>.</li> </ul> |
| <code>final.project</code>    | directory of the final Monolix project (default add "_upd" to the Monolix project).  |
| <code>pop.set</code>          | population parameters setting for final estimation (see details).  |
| <code>prune</code>            | percentage for pruning ( $\in [0; 1]$ ) in the Adaptive Gauss-Hermite algorithm used to compute the log-likelihood and its derivatives (see <a href="#">gh.LL</a> ).   |
| <code>n</code>                | number of points for gaussian quadrature (see <a href="#">gh.LL</a> ).   |
| <code>parallel</code>         | logical, if the computation should be done in parallel when possible (default TRUE).   |
| <code>ncores</code>           | number of cores for parallelization (default NULL and <a href="#">detectCores</a> is used).  |
| <code>print</code>            | logical, if the results and algorithm steps should be displayed in the console (default to TRUE).  |
| <code>digits</code>           | number of digits to print (default to 3).  |
| <code>trueValue</code>        | -for simulation purposes- named vector of true value for parameters.   |
| <code>test</code>             | if Wald test should be computed at the end of the iteration.   |
| <code>p.max</code>            | maximum value to each for wald test p.value (default 0.05).  |

## Details

For population parameter estimation settings, see (<https://monolixsuite.slp-software.com/r-functions/2024R1/setpopulation>)

**Value**

a remix object on which final SAEM and test, if test is TRUE, have been computed.

**Examples**

```
## Not run:
project <- getMLXdir()

ObsModel.transfo = list(S=list(AB=log10),
                        linkS="yAB",
                        R=rep(list(S=function(x){x}),5),
                        linkR = paste0("yG",1:5))

alpha=list(alpha0=NULL,
           alpha1=setNames(paste0("alpha_1",1:5),paste0("yG",1:5)))

y = c(S=5,AB=1000)

res = cv.remix(project = project,
               dynFUN = dynFUN_demo,
               y = y,
               ObsModel.transfo = ObsModel.transfo,
               alpha = alpha,
               selfInit = TRUE,
               eps1=10**(-2),
               ncores=8,
               nlambda=8,
               eps2=1)

res_with_test = computeFinalTest(retrieveBest(res0,criterion=BICc),
                                dynFUN_demo,
                                y,
                                ObsModel.transfo)

## End(Not run)
```

---

cv.remix

*REMixed algorithm over a grid of  $\lambda$* 

---

**Description**

Regularization and Estimation in Mixed effects model, over a regularization path.

**Usage**

```
cv.remix(
  project = NULL,
  final.project = NULL,
  dynFUN,
```

```

y,
ObsModel.transfo,
alpha,
lambda.grid = NULL,
alambda = 0.001,
nlambda = 50,
lambda_max = NULL,
eps1 = 10(-2),
eps2 = 10(-1),
selfInit = FALSE,
pop.set1 = NULL,
pop.set2 = NULL,
prune = NULL,
n = NULL,
parallel = TRUE,
ncores = NULL,
print = TRUE,
digits = 3,
trueValue = NULL,
unlinkBuildProject = TRUE,
max.iter = +Inf
)

```

## Arguments

- |                  |   |
|------------------|---|
| project          | directory of the Monolix project (in .mlxtran). If NULL, the current loaded project is used (default is NULL).  |
| final.project    | directory of the final Monolix project (default add "_upd" to the Monolix project).   |
| dynFUN           | function computing the dynamics of interest for a set of parameters. This function need to contain every sub-function that it may needs (as it is called in a foreach loop). The output of this function need to return a data.frame with time as first columns and named dynamics in other columns. It must take in input :<br><br>y a named vector with the initial condition. The names are the dynamics names.<br>parms a named vector of parameter.<br>time vector a timepoint.<br><br>See <a href="#">dynFUN_demo</a> , <a href="#">model.clairon</a> , <a href="#">model.pasin</a> or <a href="#">model.pk</a> for examples. |
| y                | initial condition of the mechanism model, conform to what is asked in dynFUN. If regressor used in Monolix provided a named list of vector of individual initial conditions. Each vector need to be of length 1 (same for all), or exactly the nombre of individuals (range in the same order as their id).   |
| ObsModel.transfo | list containing two lists of transformations and two vectors linking each transformations to their observation model name in the Monolix project. The list should include identity transformations and be named S and R. The two vectors should be named linkS and linkR.   |

Both `S` (for the direct observation models) and `linkS`, as well as `R` (for latent process models) and `linkR`, must have the same length.

`S` a list of transformations for the direct observation models. Each transformation corresponds to a variable  $Y_p = h_p(S_p)$ , where the name indicates which dynamic is observed (from `dynFUN`);

`linkS` a vector specifying the observation model names (that is used in the `monolix` project, `alpha1`, etc.) for each transformation, in the same order as in `S`;

`R` similarly, a list of transformations for the latent process models. Although currently there is only one latent dynamic, each  $s_k, k \leq K$  transformation corresponds to the same dynamic but may vary for each  $Y_k$  observed. The names should match the output from `dynFUN`;

`linkR` a vector specifying the observation model names for each transformation, in the same order as in `R`.

|                          |  |
|--------------------------|--|
| <code>alpha</code>       | named list of named vector "alpha0", "alpha1" (all alpha1 are mandatory). The name of <code>alpha\$alpha0</code> and <code>alpha\$alpha1</code> are the observation model names from the <code>monolix</code> project to which they are linked (if the observations models are defined without intercept, <code>alpha\$alpha0</code> need to be set to the vector <code>NULL</code> ). |
| <code>lambda.grid</code> | grid of user-supplied penalisation parameters for the lasso regularization (if <code>NULL</code> , the sequence is computed based on the data).  |
| <code>alambda</code>     | if <code>lambda.grid</code> is null, coefficients used to compute the grid (default to 0.05, see details).   |
| <code>nlambda</code>     | if <code>lambda.grid</code> is null, number of lambda parameter to test (default to 50).   |
| <code>lambda_max</code>  | if <code>lambda.grid</code> is null, maximum of the lambda grid to test (default is automatically computed, see details)   |
| <code>eps1</code>        | integer (>0) used to define the convergence criteria for the regression parameters.  |
| <code>eps2</code>        | integer (>0) used to define the convergence criteria for the likelihood.   |
| <code>selfInit</code>    | logical, if the SAEM is already done in the <code>monolix</code> project should be use as the initial point of the algorithm (if <code>FALSE</code> , SAEM is automatically compute according to <code>pop.set1</code> settings ; if <code>TRUE</code> , a SAEM through <code>monolix</code> need to have been launched).  |
| <code>pop.set1</code>    | population parameters setting for initialisation (see details).  |
| <code>pop.set2</code>    | population parameters setting for iterations.  |
| <code>prune</code>       | percentage for pruning ( $\in [0; 1]$ ) in the Adaptative Gauss-Hermite algorithm used to compute the log-likelihood and its derivates (see <a href="#">gh.LL</a> ).   |
| <code>n</code>           | number of points for gaussian quadrature (see <a href="#">gh.LL</a> ).   |
| <code>parallel</code>    | logical, if the computation should be done in parallel when possible (default <code>TRUE</code> ).   |
| <code>ncores</code>      | number of cores for parallelization (default <code>NULL</code> and <code>detectCores</code> is used).  |
| <code>print</code>       | logical, if the results and algoritihm steps should be displayed in the console (default to <code>TRUE</code> ).   |
| <code>digits</code>      | number of digits to print (default to 3).  |

`trueValue`        -for simulation purposes- named vector of true value for parameters.  
`unlinkBuildProject`  
                      logical, if the build project of each lambda should be deleted.  
`max.iter`            maximum number of iteration (default 20).

## Details

See [REMixed-package](#) for details on the model. For each  $\lambda \in \Lambda$ , the `remix` is launched. For population parameter estimation settings, see (<https://monolixsuite.slp-software.com/r-functions/2024R1/setpopulationparameters>)

## Value

A list of outputs of the final project and of the iterative process over each value of `lambda.grid`:

`info` Information about the parameters.  
`project` The project path if not unlinked.  
`lambda` The grid of  $\lambda$ .  
`BIC` Vector of BIC values for the model built over the grid of  $\lambda$ .  
`BICc` Vector of BICc values for the model built over the grid of  $\lambda$ .  
`LL` Vector of log-likelihoods for the model built over the grid of  $\lambda$ .  
`LL.pen` Vector of penalized log-likelihoods for the model built over the grid of  $\lambda$ .  
`res` List of all REMixed results for each  $\lambda$  (see [remix](#)).  
`outputs` List of all REMixed outputs for each  $\lambda$  (see [remix](#)).

## Examples

```
## Not run:
project <- getMLXdir()

ObsModel.transfo = list(S=list(AB=log10),
                        linkS="yAB",
                        R=rep(list(S=function(x){x}),5),
                        linkR = paste0("yG",1:5))

alpha=list(alpha0=NULL,
           alpha1=setNames(paste0("alpha_1",1:5),paste0("yG",1:5)))

y = c(S=5,AB=1000)

res = cv.remix(project = project,
              dynFUN = dynFUN_demo,
              y = y,
              ObsModel.transfo = ObsModel.transfo,
              alpha = alpha,
              selfInit = TRUE,
              eps1=10**(-2),
              ncores=8,
              nlambda=8,
```

```

        eps2=1)

## End(Not run)

```

---

 dynFUN\_demo

*Dynamic functions demo*

---

### Description

Example of solver for `remix` and `cv.remix` algorithm. It is perfectly adapted for the Monolix demo project (see `getMLXdir`).

### Usage

`dynFUN_demo`

### Format

`dynFUN_demo` function of `t`, `y`, `parms` :

`t` vector of timepoint.

`y` initial condition, named vector of form `c(AB=<...>, S=<...>)`.

`parms` named vector of model parameter ; should contain `phi_S, delta_AB, delta_S`.

### Details

Suppose you have antibodies secreting cells  $-S-$  that produces antibodies  $-AB-$  at rate  $\varphi_S$ . These two biological entities decay respectively at rate  $\delta_S$  and  $\delta_{AB}$ . The biological mechanism behind is :

$$\begin{cases} \frac{d}{dt}S(t) & = & -\delta_S S(t) \\ \frac{d}{dt}AB(t) & = & \varphi_S S(t) - \delta_{AB} AB(t) \\ (S(0), AB(0)) & = & (S_0, AB_0) \end{cases}$$

eBIC

*eBIC*

---

**Description**

Computes extended bayesian information criterion as

$$eBIC = -2\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha}) + P \log(N) + 2\gamma \log\left(\binom{K}{k}, K\right)$$

where  $P$  is the total number of parameters estimated,  $N$  the number of subject,  $\mathcal{L}\mathcal{L}_y(\hat{\theta}, \hat{\alpha})$  the log-likelihood of the model,  $K$  the number of submodel to explore (here the nombre of biomarkers tested) and  $k$  the nombre of biomarkers selected in the model.

**Usage**

```
eBIC(object, ...)
```

**Arguments**

object            output of `remix` or `cv.remix`.  
...                optional additional arguments.

**Value**

eBIC.

  onlyLL = FALSE,  
  verbose = TRUE,  
  precBits = 10  
)
```

**Arguments**

|                      |  |
|----------------------|--|
| dynFUN               | <p>function computing the dynamics of interest for a set of parameters. This function need to contain every sub-function that it may needs (as it is called in a foreach loop). The output of this function need to return a data.frame with time : as first columns and named dynamics in other columns. It must take in input :</p> <ul style="list-style-type: none"> <li>• y : a named vector with the initial condition. The names are the dynamics names.</li> <li>• parms : a named vector of parameter.</li> <li>• time : vector a timepoint.</li> </ul> <p>See <a href="#">dynFUN_demo</a>, <a href="#">model.clairon</a>, <a href="#">model.pasin</a> or <a href="#">model.pk</a> for examples.</p>  |
| y                    | <p>initial condition of the mechanism model, conform to what is asked in dynFUN. If regressor used in Monolix provided a named list of vector of individual initial conditions. Each vector need to be of length 1 (same for all), or exactly the nombre of individuals (range in the same order as their id).</p>   |
| mu                   | <p>list of individuals random effects estimation (vector of r.e. need to be named by the parameter names), use to locate the density mass; (optional, see description).</p>  |
| Omega                | <p>list of individuals estimated standard deviation diagonal matrix (matrix need to have rows and columns named by the parameter names), use to locate the density mass; (optional, see description).</p>  |
| theta                | <p>list of model parameters containing (see details)</p> <ul style="list-style-type: none"> <li>• phi_pop : named vector with the population parameters with no r.e. <math>(\phi_{l\ pop})_{l \leq L}</math> (NULL if none) ;</li> <li>• psi_pop : named vector with the population parameters with r.e. <math>(\psi_{l\ pop})_{l \leq m}</math> ;</li> <li>• gamma : named list (for each parameters) of named vector (for each covariates) of covariate effects from parameters with no r.e. ;</li> <li>• beta : named list (for each parameters) of named vector (for each covariates) of covariate effects from parameters with r.e..</li> <li>• alpha0 : named vector of <math>(\alpha_{0k})_{k \leq K}</math> parameters (names are identifier of the observation model, such as in a Monolix project);</li> <li>• omega : named vector of estimated r.e. standard deviation;</li> </ul> <p>(optional, see description).</p> |
| alpha1               | <p>named vector of regulatization parameters <math>(\alpha_{1k})_{k \leq K}</math>, with identifier of observation model as names, (optional, see description).</p>  |
| covariates           | <p>matrix of individual covariates (size N x n). Individuals must be sorted in the same order than in mu and Omega, (optional, see description).</p>   |
| ParModel.transfo     | <p>named list of transformation functions <math>(h_l)_{l \leq m}</math> and <math>(s_k)_{k \leq K}</math> for the individual parameter model (names must be consistent with phi_pop and psi_pop, missing entries are set by default to the identity function ; optional, see description).</p>   |
| ParModel.transfo.inv | <p>Named list of inverse transformation functions for the individual parameter model (names must be consistent with phi_pop and psi_pop ; optional, see description).</p>  |

|                  |  |
|------------------|--|
| Sobs             | list of individuals trajectories for the direct observation models $(Y_{pi})_{p \leq P, i \leq N}$ . Each element $i \leq N$ of the list, is a list of $p \leq P$ data.frame with time $(t_{pij})_{j \leq n_{ip}}$ and observations $(Y_{pij})_{j \leq n_{ip}}$ . Each data.frame is named with the observation model identifiers.   |
| Robs             | list of individuals trajectories for the latent observation models $(Z_{ki})_{k \leq K, i \leq N}$ . Each element $i \leq N$ of the list, is a list of $k \leq K$ data.frame with time $(t_{kij})_{j \leq n_{ik}}$ and observations $(Z_{kij})_{j \leq n_{ik}}$ . Each data.frame is named with the observation model identifiers.   |
| Serr             | named vector of the estimated error model constants $(\varsigma_p)_{p \leq P}$ with observation model identifiers as names.  |
| Rerr             | named vector of the estimated error model constants $(\sigma_k)_{k \leq K}$ with observation model identifiers as names.   |
| ObsModel.transfo | list containing two lists of transformations and two vectors linking each transformations to their observation model name in the Monolix project. The list should include identity transformations and be named S and R. The two vectors should be named linkS and linkR.<br>Both S (for the direct observation models) and linkS, as well as R (for latent process models) and linkR, must have the same length. <ul style="list-style-type: none"> <li>• S: a list of transformations for the direct observation models. Each transformation corresponds to a variable <math>Y_p = h_p(S_p)</math>, where the name indicates which dynamic is observed (from dynFUN);</li> <li>• linkS: a vector specifying the observation model names (that is used in the monolix project, alpha1, etc.) for each transformation, in the same order as in S;</li> <li>• R: similarly, a list of transformations for the latent process models. Although currently there is only one latent dynamic, each <math>s_k, k \leq K</math> transformation corresponds to the same dynamic but may vary for each <math>Y_k</math> observed. The names should match the output from dynFUN;</li> <li>• linkR: a vector specifying the observation model names for each transformation, in the same order as in R.</li> </ul> |
| data             | output from readMLX containing parameters "mu", "Omega", "theta", "alpha1", "covariates", "ParModel.transfo", "ParModel.transfo.inv", "Sobs", "Robs", "Serr", "Rerr", "ObsModel.transfo" extract from a monolix project.   |
| n                | number of points per dimension to use for the Gauss-Hermite quadrature rule.   |
| prune            | integer between 0 and 1, percentage of pruning for the Gauss-Hermite quadrature rule (default NULL).   |
| parallel         | logical, if computation should be done in parallel.  |
| ncores           | number of cores to use for parallelization, default will detect the number of cores available.   |
| onlyLL           | logical, if only the log-likelihood should be computed (and not $\partial_{\alpha_1} LL$ or $\partial_{\alpha_1}^2 LL$ ).  |
| verbose          | logical, if progress bar should be printed through the computation.  |
| precBits         | precision if needed  |

## Details

Based on notation introduced [REMixed-package](#). The log-likelihood of the model  $LL(\theta, \alpha_1)$  for a set of population parameters  $\theta$  and regularization parameters  $\alpha_1$  is estimated using Adaptive Gausse-Hermite quadrature, using conditional distribution estimation to locate the mass of the integrand. If the project has been initialized as a Monolix project, the user can use [readMLX](#) function to retrieve all the project information needed here.

## Value

A list with the approximation by Gauss-Hermite quadrature of the likelihood L, the log-likelihood LL, the gradient of the log-likelihood dLL, and the Hessian of the log-likelihood ddLL at the point  $\theta, \alpha$  provided.

## Examples

```
## Not run:
project <- getMLXdir()

ObsModel.transfo = list(S=list(AB=log10),
                        linkS="yAB",
                        R=rep(list(S=function(x){x}),5),
                        linkR = paste0("yG",1:5))

alpha=list(alpha0=NULL,
           alpha1=setNames(paste0("alpha_1",1:5),paste0("yG",1:5)))

data <- readMLX(project,ObsModel.transfo,alpha)

LL <- gh.LL(dynFUN = dynFUN_demo,
            y = c(S=5,AB=1000),
            ObsModel.transfo=ObsModel.transfo,
            data = data)

print(LL)

## End(Not run)
```

---

indParm

*Generate individual parameters*

---

## Description

Generate the individual parameters of individual whose covariates are covariates and random effects  $\eta_{i.}$

## Usage

```
indParm(theta, covariates, eta_i, transfo, transfo.inv)
```

**Arguments**

|             |   |
|-------------|---|
| theta       | list with at least phi_pop, psi_pop, gamma, beta (named ; corresponding to the model parameter $\phi_{pop}, \psi_{pop}, \gamma, \beta$ ) : <ul style="list-style-type: none"> <li>• phi_pop named vector of population parameters without r.e ;</li> <li>• psi_pop named vector of population parameters with r.e ;</li> <li>• gamma named list of vector of covariates effects for phi_pop parameters, if NULL no covariates effect on parameters. ;</li> <li>• beta named list of vector of covariates effects for each psi_pop, if NULL no covariates effect on parameters.</li> </ul> |
| covariates  | line data.frame of individual covariates ;  |
| eta_i       | named vector of random effect for each psi parameter ;  |
| transfo     | named list of transformation functions $(h_l)_{l \leq m}$ and $(s_k)_{k \leq K}$ for the individual parameter model (names must be consistent with phi_pop and psi_pop, missing entries are set by default to the identity function).   |
| transfo.inv | amed list of inverse transformation functions for the individual parameter model (names must be consistent withphi_pop andpsi_pop).   |

**Details**

The models used for the parameters are :

$$h_l(\psi_{li}) = h_l(\psi_{lpop}) + X_i \beta_l + \eta_i$$

with  $h_l$  the transformation,  $\beta_l$  the vector of covariates effect and with  $\eta_i$  the random effects associated  $\psi_l$  parameter ;

$$g_k(\phi_{ki}) = g_k(\phi_{kpop}) + X_i \gamma_k$$

with  $g_k$  the transformation and  $\gamma_k$  the vector of covariates effect associated  $\phi_k$  parameter.

**Value**

a list with phi\_i and psi\_i parameters.

**See Also**

[model.clairon](#), [model.pasin](#).

**Examples**

```
phi_pop = c(delta_S = 0.231, delta_L = 0.000316)
psi_pop = c(delta_Ab = 0.025, phi_S = 3057, phi_L = 16.6)
gamma = NULL
covariates = data.frame(cAGE = runif(1,-15,15), G1 = rnorm(1), G2 = rnorm(1))
beta = list(delta_Ab=c(0,1.2,0), phi_S = c(0.93,0,0), phi_L=c(0,0,0.8))

theta=list(phi_pop = phi_pop, psi_pop = psi_pop, gamma = gamma, beta = beta)
eta_i = c(delta_Ab = rnorm(1,0,0.3), phi_S=rnorm(1,0,0.92), phi_L=rnorm(1,0,0.85))
transfo = list(delta_Ab=log, phi_S=log, phi_L=log)
transfo.inv = list(delta_Ab = exp, phi_S=exp, phi_L=exp)
```

```
indParm(theta,covariates,eta_i,transfo,transfo.inv)
```

|           |                                |
|-----------|--------------------------------|
| initStrat | <i>Initialization strategy</i> |
|-----------|--------------------------------|

---

### Description

Selecting an initialization point by grouping biomarkers of project and running the SAEM. Initial condition is then selected using maximum log-likelihood.

### Usage

```
initStrat(
  project,
  alpha,
  ObsModel.transfo,
  Nb_genes = 2,
  trueValue = NULL,
  pop.set = NULL,
  useSettingsInAPI = FALSE,
  conditionalDistributionSampling = FALSE,
  print = TRUE,
  digits = 2,
  unlinkTemporaryProject = TRUE,
  seed = NULL
)
```

### Arguments

- |                  |  |
|------------------|--|
| project          | directory of the Monolix project (in .mlxtran). If NULL, the current loaded project is used (default is NULL).   |
| alpha            | named list of named vector "alpha0", "alpha1" (all alpha1 are mandatory). The name of alpha\$alpha0 and alpha\$alpha1 are the observation model names from the monolix project to which they are linked (if the observations models are defined without intercept, alpha\$alpha0 need to be set to the vector NULL).   |
| ObsModel.transfo | list containing two lists of transformations and two vectors linking each transformations to their observation model name in the Monolix project. The list should include identity transformations and be named S and R. The two vectors should be named linkS and linkR.<br>Both S (for the direct observation models) and linkS, as well as R (for latent process models) and linkR, must have the same length. <ul style="list-style-type: none"> <li>• S: a list of transformations for the direct observation models. Each transformation corresponds to a variable <math>Y_p = h_p(S_p)</math>, where the name indicates which dynamic is observed (from dynFUN);</li> </ul> |

- linkS : a vector specifying the observation model names (that is used in the monolix project, alpha1, etc.) for each transformation, in the same order as in S;
- R: similarly, a list of transformations for the latent process models. Although currently there is only one latent dynamic, each  $s_k, k \leq K$  transformation corresponds to the same dynamic but may vary for each  $Y_k$  observed. The names should match the output from dynFUN;
- linkR : a vector specifying the observation model names for each transformation, in the same order as in R.

|                                 |  |
|---------------------------------|--|
| Nb_genes                        | Size of group of genes.  |
| trueValue                       | -for simulation purposes- named vector of true value for parameters.                               |
| pop.set                         | population parameters setting for initialization (see details).                                    |
| useSettingsInAPI                | logical, if the settings for SAEM should not be changed from what is currently set in the project. |
| conditionalDistributionSampling | logical, if conditional distribution estimation should be done on the final project.               |
| print                           | logical, if the results and algorithm steps should be displayed in the console (default to TRUE).  |
| digits                          | number of digits to print (default to 2).  |
| unlinkTemporaryProject          | If temporary project (of genes group) is deleted (default: TRUE)                                   |
| seed                            | value of the seed used to initialize the group (see set.seed).                                     |

## Details

For population parameter estimation settings, see (<https://monolixsuite.slp-software.com/r-functions/2024R1/setpopulation>)

## Value

a list of outputs for every group of genes tested with composition of the group, final parameter estimates, final scores estimates (OFV, AIC, BIC, BICc), temporary project directory. The final selected set is initialize in the project.

## Examples

```
## Not run:
project <- getMLXdir()

ObsModel.transfo = list(S=list(AB=log10),
                        linkS="yAB",
                        R=rep(list(S=function(x){x}),5),
                        linkR = paste0("yG",1:5))

alpha=list(alpha0=NULL,
           alpha1=setNames(paste0("alpha_1",1:5),paste0("yG",1:5)))
```

```

initStrat(project,alpha,ObsModel.transfo,seed=1710)

## End(Not run)

```

---

model.clairon                      *Model from Clairon and al.,2023*

---

## Description

Generates the dynamics of antibodies secreting cells  $-S-$  that produces antibodies  $-AB-$  over time, with two injection of vaccine at time  $t_0 = 0$  and  $t_{inj}$ , using Clairon and al., 2023, model.

## Usage

```
model.clairon(t, y, parms, tinj = 21)
```

## Arguments

|       |  |
|-------|--|
| t     | vector of timepoint.   |
| y     | initial condition, named vector of form c(S=S0,Ab=A0).   |
| parms | named vector of model parameter (should contain "fM2","theta","delta_S","delta_Ab","delta_V"). |
| tinj  | time of injection (default to 21).   |

## Details

Model is defined as

$$\begin{cases} \frac{d}{dt}S(t) &= f_{\overline{M}_k} e^{-\delta_V(t-t_k)} - \delta_S S(t) \\ \frac{d}{dt}Ab(t) &= \theta S(t) - \delta_{Ab} Ab(t) \end{cases}$$

on each interval  $I_1 = [0; t_{inj}[$  and  $I_2 = [t_{inj}; +\infty[$ . For each interval  $I_k$ , we have  $t_k$  corresponding to the last injection date of vaccine, such that  $t_1 = 0$  and  $t_2 = t_{inj}$ . By definition,  $f_{\overline{M}_1} = 1$  (Clairon and al., 2023).

## Value

Matrix of time and observation of antibody secreting cells  $S$  and antibody titer  $Ab$ .

*Model from Pasin and al.,2019*

---

**Description**

Generate trajectory of the Humoral Immune Response to a Prime-Boost Ebola Vaccine.

**Usage**

```
model.pasin(t, y, parms)
```

**Arguments**

t                    vector of time ;  
y                    initial condition, named vector of form c(Ab=<...>,S=<...>,L=<...>) ;  
parms                named vector of model parameter ; should contain "theta\_S","theta\_L","delta\_Ab","delta\_S","delta\_V"

**Details**

The model correspond to the dynamics of the humoral response, from 7 days after the boost immunization with antibodies secreting cells  $S$  and  $L$ , characterized by their half lives- that produces antibodies  $AB$ - at rate  $\theta_S$  and  $\theta_L$ . All these biological entities decay at rate repectively  $\delta_S$ ,  $\delta_L$  and  $\delta_{Ab}$ . Model is then defined as

$$\begin{cases} \frac{d}{dt} Ab(t) &= \theta_S S(t) + \theta_L L(t) - \delta_{Ab} Ab(t) \\ \frac{d}{dt} S(t) &= -\delta_S S(t) \\ \frac{d}{dt} L(t) &= -\delta_L L(t) \end{cases}$$

**Value**

Matrix of time and observation of antibody titer Ab, and ASCs S and L.

parms = c(theta_S = 611,
          theta_L = 3.5,
          delta_Ab = 0.025,
          delta_S = 0.231,
          delta_L = 0.000152)

t = seq(0,100,5)
res <- model.pasin(t,y,parms)
plot(res)
```

---

model.pk

*Generate trajectory of PK model*

---

**Description**

The administration is via a bolus. The PK model has one compartment (volume V) and a linear elimination (clearance Cl). The parameter ka is defined as  $ka = \frac{Cl}{V}$ .

**Usage**

```
model.pk(t, y, parms)
```

**Arguments**

t                    vector of time ;  
y                    initial condition, named vector of form c(C=C0) ;  
parms                named vector of model parameter ; should contain either "Cl" and "V" or "ka".

**Value**

Matrix of time and observation of Concentration C.

**See Also**[indParm.](#)**Examples**

```
res <- model.pk(seq(0,30,1),c(C=100),parms=c(ka=1))
```

```
plot(res)
```

---

plot.cvRemix

*Plot of cv.remix object*

---

**Description**

Calibration plot for cvRemix object.

**Usage**

```
## S3 method for class 'cvRemix'  
plot(x, criterion = BICc, trueValue = NULL, ...)
```

**Arguments**

|           |  |
|-----------|--|
| x         | output of <a href="#">cv.remix</a> .   |
| criterion | which criterion function to take into account. Default is the function 'BICc', but one can use 'BIC', 'AIC', 'eBIC' or any function depending on a 'cvRemix' object. |
| trueValue | -for simulation purposes- named vector of true value for parameters.   |
| ...       | optional additional arguments.   |

**Value**

A plot.

**See Also**[cv.remix](#)

---

|                 |                         |
|-----------------|-------------------------|
| plotCalibration | <i>Calibration plot</i> |
|-----------------|-------------------------|

---

## Description

Calibration plot

## Usage

```
plotCalibration(  
  fit,  
  legend.position = "none",  
  trueValue = NULL,  
  criterion = BICc,  
  dismin = TRUE  
)
```

## Arguments

|                 |   |
|-----------------|---|
| fit             | fit object of class cvRemix, from <a href="#">cv.remix</a> .  |
| legend.position | (default NULL) the default position of legends ("none", "left", "right", "bottom", "top", "inside").                                |
| trueValue       | (for simulation purpose) named vector containing the true value of regularization parameter.  |
| criterion       | function ; which criterion among 'BIC', 'eBIC', 'AIC', 'BICc', or function of cvRemix object to take into account (default : BICc). |
| dismin          | logical ; if minimizers of information criterion should be display.   |

## Value

Calibration plot, over the lambda.grid.

## End(Not run)
```

---

plotSAEM

*Display the value of parameters at each iteration*

---

**Description**

Display the value of parameters at each iteration

**Usage**

```
plotSAEM(fit, paramToPlot = "all", trueValue = NULL)
```

**Arguments**

`fit` object of class `remix`, from `remix` or a certain build from `cv.remix` output.

`paramToPlot` Population parameters to plot (which have been estimated by SAEM) ;

`trueValue` (for simulation purpose) vector named of true values ;

**Value**

For each parameters, the values at the end of each iteration of `remix` algorithm is drawn. Moreover, the SAEM steps of each iteration are displayed.

**See Also**

[remix](#), [cv.remix](#).

**Examples**

```
## Not run:
project <- getMLXdir()

ObsModel.transfo = list(S=list(AB=log10),

            lambda=lambda)

plotConvergence(res)

trueValue = read.csv(paste0(dirname(project),"/demoSMLX/Simulation/populationParameters.txt"))

plotSAEM(res,paramToPlot = c("delta_S_pop","phi_S_pop","delta_AB_pop"),trueValue=trueValue)

## End(Not run)
```

readMLX

*Extract Data for REMixed Algorithm from a Monolix Project***Description**

This function retrieves all necessary information from a Monolix project file to format the input for the REMixed package. It gathers all relevant data required for the REMix algorithm.

**Usage**

```
readMLX(project = NULL, ObsModel.transfo, alpha)
```

**Arguments**

- `project` directory of the Monolix project (in `.mlxtran`). If `NULL`, the current loaded project is used (default is `NULL`).
- `ObsModel.transfo` list containing two lists of transformations and two vectors linking each transformations to their observation model name in the Monolix project. The list should include identity transformations and be named `S` and `R`. The two vectors should be named `linkS` and `linkR`.
- Both `S` (for the direct observation models) and `linkS`, as well as `R` (for latent process models) and `linkR`, must have the same length.
- `S`: a list of transformations for the direct observation models. Each transformation corresponds to a variable  $Y_p = h_p(S_p)$ , where the name indicates which dynamic is observed (from `dynFUN`);
  - `linkS`: a vector specifying the observation model names (that is used in the monolix project, `alpha1`, etc.) for each transformation, in the same order as in `S`;
  - `R`: similarly, a list of transformations for the latent process models. Although currently there is only one latent dynamic, each  $s_k, k \leq K$  transformation corresponds to the same dynamic but may vary for each  $Y_k$  observed. The names should match the output from `dynFUN`;
  - `linkR`: a vector specifying the observation model names for each transformation, in the same order as in `R`.
- `alpha` named list of named vector "alpha0", "alpha1" (all alpha1 are mandatory). The names of `alpha$alpha0` and `alpha$alpha1` are the observation model names from the monolix project to which they are linked (if the observations models are defined without intercept, `alpha$alpha0` need to be set to the vector `NULL`).

**Details**

To simplify its use, functions `remix`, `cv.remix`, `gh.LL` can be used with arguments `data` rather than all necessary informations "theta", "alpha1", "covariates", "ParModel.transfo", "ParModel.transfo.inv",

"Sobs", "Robs", "Serr", "Rerr", "ObsModel.transfo" that could be extract from a monolix project. If the SAEM task of the project hasn't been launched, it's the initial condition and not the estimated parameters that are returned. If the conditional distribution estimation task has been launched, parameters "mu" and "Omega" are returned too.

### Value

A list containing parameters, transformations, and observations from the Monolix project in the format needed for the REMixed algorithm :

- mu list of individuals random effects estimation (vector of r.e. need to be named by the parameter names), use to locate the density mass (if conditional distribution estimation through Monolix has been launched);
- Omega list of individuals estimated standard deviation diagonal matrix (matrix need to have rows and columns named by the parameter names), use to locate the density mass (if conditional distribution estimation through Monolix has been launched);
- theta list of model parameters containing i
  - phi\_pop : named vector with the population parameters with no r.e.  $(\phi_{l\ pop})_{l \leq L}$  (NULL if none) ;
  - psi\_pop : named vector with the population parameters with r.e.  $(\psi_{l\ pop})_{l \leq m}$  ;
  - gamma : named list (for each parameters) of named vector (for each covariates) of covariate effects from parameters with no r.e. ;
  - beta : named list (for each parameters) of named vector (for each covariates) of covariate effects from parameters with r.e..
  - alpha0 : named vector of  $(\alpha_{0k})_{k \leq K}$  parameters (names are identifier of the observation model, such as in a Monolix project);
  - omega : named vector of estimated r.e. standard deviation;
- alpha1 named vector of regularization parameters  $(\alpha_{1k})_{k \leq K}$ , with identifier of observation model as names;
- covariates matrix of individual covariates (size N x n). Individuals must be sorted in the same order than in mu and Omega;
- ParModel.transfo named list of transformation functions  $(h_l)_{l \leq m}$  and  $(s_k)_{k \leq K}$  for the individual parameter model (names must be consistent with phi\_pop and psi\_pop, missing entries are set by default to the identity function) ;
- ParModel.transfo.inv named list of inverse transformation functions for the individual parameter model (names must be consistent with phi\_pop and psi\_pop) ;
- Sobs list of individuals trajectories for the direct observation models  $(Y_{pi})_{p \leq P, i \leq N}$ . Each element  $i \leq N$  of the list, is a list of  $p \leq P$  data.frame with time  $(t_{pij})_{j \leq n_{ip}}$  and observations  $(Y_{pij})_{j \leq n_{ip}}$ . Each data.frame is named with the observation model identifiers ;
- Robs list of individuals trajectories for the latent observation models  $(Z_{ki})_{k \leq K, i \leq N}$ . Each element  $i \leq N$  of the list, is a list of  $k \leq K$  data.frame with time  $(t_{kij})_{j \leq n_{ik}}$  and observations  $(Z_{kij})_{j \leq n_{ik}}$ . Each data.frame is named with the observation model identifiers ;
- Serr named vector of the estimated error model constants  $(\varsigma_p)_{p \leq P}$  with observation model identifiers as names ;
- Rerr named vector of the estimated error model constants  $(\sigma_k)_{k \leq K}$  with observation model identifiers as names ;
- ObsModel.transfo same as inputObsModel.transfo list.

ObsModel.transfo = list(S=list(AB=log10),
                        linkS="yAB",
                        R=rep(list(S=function(x){x}),5),
                        linkR = paste0("yG",1:5))

alpha=list(alpha0=NULL,
           alpha1=setNames(paste0("alpha_1",1:5),paste0("yG",1:5)))

res <- readMLX(project,ObsModel.transfo,alpha)

## End(Not run)
```

---

remix

*REMixed algorithm*

---

**Description**

Regularization and Estimation in Mixed effects model.

**Usage**

```
remix(
  project = NULL,
  final.project = NULL,
  dynFUN,
  y,
  ObsModel.transfo,
  alpha,
  lambda,
  eps1 = 10-2,
  eps2 = 10-1,
  selfInit = FALSE,
  pop.set1 = NULL,
  pop.set2 = NULL,
  pop.set3 = NULL,
  prune = NULL,
  n = NULL,
  parallel = TRUE,
  ncores = NULL,
  print = TRUE,
```

```

verbose = FALSE,
digits = 3,
trueValue = NULL,
finalSAEM = FALSE,
test = TRUE,
max.iter = +Inf,
p.max = 0.05
)

```

## Arguments

- project** directory of the Monolix project (in `.mlxtran`). If `NULL`, the current loaded project is used (default is `NULL`).
- final.project** directory of the final Monolix project (default add `"_upd"` to the Monolix project).
- dynFUN** function computing the dynamics of interest for a set of parameters. This function need to contain every sub-function that it may needs (as it is called in a `foreach` loop). The output of this function need to return a `data.frame` with time as first columns and named dynamics in other columns. It must take in input :
- `y` a named vector with the initial condition. The names are the dynamics names.
  - `parms` a named vector of parameter.
  - `time` vector a timepoint.
- See [dynFUN\\_demo](#), [model.clairon](#), [model.pasin](#) or [model.pk](#) for examples.
- y** initial condition of the mechanism model, conform to what is asked in `dynFUN`. If regressor used in Monolix provided a named list of vector of individual initial conditions. Each vector need to be of length 1 (same for all), or exactly the nombre of individuals (range in the same order as their id).
- ObsModel.transfo** list containing two lists of transformations and two vectors linking each transformations to their observation model name in the Monolix project. The list should include identity transformations and be named `S` and `R`. The two vectors should be named `linkS` and `linkR`.
- Both `S` (for the direct observation models) and `linkS`, as well as `R` (for latent process models) and `linkR`, must have the same length.
- `S` a list of transformations for the direct observation models. Each transformation corresponds to a variable  $Y_p = h_p(S_p)$ , where the name indicates which dynamic is observed (from `dynFUN`);
- `linkS` a vector specifying the observation model names (that is used in the monolix project, `alpha1`, etc.) for each transformation, in the same order as in `S`;
- `R` similarly, a list of transformations for the latent process models. Although currently there is only one latent dynamic, each  $s_k, k \leq K$  transformation corresponds to the same dynamic but may vary for each  $Y_k$  observed. The names should match the output from `dynFUN`;
- `linkR` a vector specifying the observation model names for each transformation, in the same order as in `R`.

|           |  |
|-----------|--|
| alpha     | named list of named vector "alpha0", "alpha1" (all alpha1 are mandatory). The name of alpha\$alpha0 and alpha\$alpha1 are the observation model names from the monolix project to which they are linked (if the observations models are defined without intercept, alpha\$alpha0 need to be set to the vector NULL). |
| lambda    | penalization parameter $\lambda$ .   |
| eps1      | integer (>0) used to define the convergence criteria for the regression parameters.  |
| eps2      | integer (>0) used to define the convergence criteria for the likelihood.   |
| selfInit  | logical, if the SAEM is already done in the monolix project should be use as the initial point of the algorithm (if FALSE, SAEM is automatically compute according to pop.set1 settings ; if TRUE, a SAEM through monolix need to have been launched).   |
| pop.set1  | population parameters setting for initialisation (see details).  |
| pop.set2  | population parameters setting for iterations.  |
| pop.set3  | population parameters setting for final estimation.  |
| prune     | percentage for pruning ( $\in [0; 1]$ ) in the Adaptative Gauss-Hermite algorithm used to compute the log-likelihood and its derivatives (see <a href="#">gh.LL</a> ).   |
| n         | number of points for gaussian quadrature (see <a href="#">gh.LL</a> ).   |
| parallel  | logical, if the computation should be done in parallel when possible (default TRUE).   |
| ncores    | number of cores for parallelization (default NULL and <a href="#">detectCores</a> is used).  |
| print     | logical, if the results and algorithm steps should be displayed in the console (default to TRUE).  |
| verbose   | logical, if progress bar should be printed when possible.  |
| digits    | number of digits to print (default to 3).  |
| trueValue | -for simulation purposes- named vector of true value for parameters.   |
| finalSAEM | logical, if a final SAEM should be launch with respect to the final selected set.  |
| test      | if Wald test should be computed at the end of the iteration.   |
| max.iter  | maximum number of iterations (default 20).   |
| p.max     | maximum value to each for wald test p.value (default 0.05).  |

### Details

See [REmixed-package](#) for details on the model. For population parameter estimation settings, see (<https://monolixsuite.slp-software.com/r-functions/2024R1/setpopulationparameterestimationsettings>).

### Value

a list of outputs of final project and through the iteration :

info informations about the parameters (project path, regularization and population parameter names, alpha names, value of lambda used, if final SAEM and test has been computed, parameters p.max and  $N$ ) ;

`finalRes` containing loglikelihood LL and penalized loglikelihood LL.pen values, final population parameters `param` and final regularization parameters `alpha` values, number of iterations `iter` and time needed , if computed, the estimated standard errors `standardError` and if test computed, the final results before test `saemBeforeTest` ;

`iterOutputs` the list of all remix outputs, i.e. parameters, liekelihood, SAEM estimates and convergence criterion value over the iteration.

## End(Not run)
```

**Description**

Extracts the build minimizing an information criterion over a grid of lambda.

**Usage**

```
retrieveBest(fit, criterion = BICc)
```

**Arguments**

|           |  |
|-----------|--|
| fit       | output of <code>cv.remix</code> ;  |
| criterion | which criterion function to take into account. Default is the function 'BICc', but one can use 'BIC', 'AIC', 'eBIC' or any function depending on a 'cvRemix' object. |

**Value**

outputs from `remix` algorithm achieving the best IC among those computed by `cv.remix`.

**See Also**

[cv.remix](#), [remix](#), [BIC.remix](#), [eBIC](#), [AIC.remix](#), [BICc](#).

**Examples**

```
