

Package ‘contingency’

July 22, 2025

Title Discrete Multivariate Probability Distributions

Version 0.0.10

Description Provides an object class for dealing with many multivariate probability distributions at once, useful for simulation.

Depends R (>= 3.5.0), rje

License GPL-2

Suggests knitr, rmarkdown, testthat

aperm.tables	<i>Permute dimensions of tables</i>
--------------	-------------------------------------

Description

Method for permuting indices of tables object.

Usage

```
## S3 method for class 'tables'
aperm(a, perm, ...)
```

Arguments

a	object of class tables
perm	permutation of 1,...,k, where each table has k dimensions
...	other arguments to methods

Value

A permuted tables object.

as.array.tables	<i>Convert tables into array</i>
-----------------	----------------------------------

Description

Convert tables into array

Usage

```
## S3 method for class 'tables'  
as.array(x, ...)
```

Arguments

x	tables object
...	other arguments

Value

An array object

as.matrix.tables	<i>Convert tables into matrix</i>
------------------	-----------------------------------

Description

Convert tables into matrix

Usage

```
## S3 method for class 'tables'  
as.matrix(x, ...)
```

Arguments

x	tables object
...	other arguments

Value

A matrix object

`as_tables`*As tables*

Description

As tables

Usage

```
as_tables(x, tdim, ...)
```

Arguments

<code>x</code>	array or matrix object
<code>tdim</code>	dimensions for each table
<code>...</code>	other arguments for methods

Value

A tables object.

`capply`*Apply function over tables*

Description

Apply a function to each contingency table in a tables object.

Usage

```
capply(x, f, ...)
```

Arguments

<code>x</code>	object of class tables
<code>f</code>	function to apply to each table
<code>...</code>	additional arguments to f

Value

a vector, matrix or list of outputs from the function f.

checkCI	<i>Check conditional independence</i>
---------	---------------------------------------

Description

Gives a numerical check that a (conditional) independence holds in a probability distribution.

Usage

```
checkCI(x, A, B, C = integer(0), eps = .Machine$double.eps, ...)
```

```
## S3 method for class 'array'  
checkCI(x, A, B, C = integer(0), eps = .Machine$double.eps, ...)
```

```
## S3 method for class 'tables'  
checkCI(x, A, B, C = integer(0), eps = .Machine$double.eps, ...)
```

Arguments

x	an array or object of class tables
A, B	the sets of variables whose independence is to be tested
C	conditioning set (possibly empty)
eps	tolerance parameter
...	other arguments to methods

Details

just tests to an appropriate numerical precision that a conditional independence holds: this is **not** a statistical test for conditional independence. If A and B overlap with C then these vertices are ignored. If A and B intersect with one another (but not C) then the solution is always false.

Value

A logical, or a vector of logicals of the same length as the number of tables provided, indicating whether the conditional independence seems to hold numerically.

Methods (by class)

- array: method for array object
- tables: method for tables object

entropy	<i>Calculate entropy of discrete distribution</i>
---------	---

Description

Calculate entropy of discrete distribution

Usage

```
entropy(p, ...)  
  
## Default S3 method:  
entropy(p, ...)  
  
## S3 method for class 'array'  
entropy(p, margin, ...)  
  
## S3 method for class 'tables'  
entropy(p, margin, ...)
```

Arguments

p	non-negative numeric vector
...	other arguments to methods
margin	margin to consider

Value

A numeric value of the entropy, or vector of entropies.

Methods (by class)

- default: Default method for vectors
- array: Method for arrays
- tables: Method for tables object

interactionInf	<i>Interaction information</i>
----------------	--------------------------------

Description

Interaction information

Usage

```
interactionInf(p, ...)

## Default S3 method:
interactionInf(p, ..., condition)
```

Arguments

p	object to find interaction information for
...	other arguments to methods
condition	variables on which to condition

Value

Numeric value for interaction information, or a vector of interaction information values.

Methods (by class)

- default: Default method for vectors

k1	<i>Kullback-Leibler Divergence</i>
----	------------------------------------

Description

Get the KL Divergence between two discrete distributions

Usage

```
k1(x, y, ...)

## Default S3 method:
k1(x, y, ...)

## S3 method for class 'tables'
k1(x, y, ...)
```

Arguments

x, y vectors (of probabilities)
 ... other arguments to methods

Value

a numeric value, vector or matrix of KL-divergences.

Methods (by class)

- default: Default method for vectors
- tables: Method for tables object

margin	<i>Get margin of a table or tables</i>
--------	--

Description

Get margin of a table or tables

Usage

```
margin(x, ...)
margin2(x, ...)
conditional(x, ...)
conditional2(x, ...)
intervention(x, ...)
```

Arguments

x a contingency table or tables object
 ... a contingency table or tables object

Details

margin2 keeps all dimensions, and hence results will sum to the number of cells summed over.

Value

an object of the same class as x. The resulting array, or collection of tables, will contain a marginal, conditional or interventional distribution.

Functions

- margin2: keep all dimensions
- conditional: conditional distributions
- conditional2: conditional distributions with all dimensions kept
- intervention: interventional distributions

margin.tables	<i>Get the marginal distributions</i>
---------------	---------------------------------------

Description

Get the marginal distributions

Usage

```
## S3 method for class 'tables'  
margin(x, margin = NULL, order = TRUE, ...)
```

Arguments

x	an object of class tables
margin	integer vector giving margin to be calculated (1 for rows, etc.)
order	logical indicating whether resulting indices should be in the same order as stated in margin
...	other arguments to function

Details

Calculates marginal distributions for each entry in a probMat.

Value

An object of class tables consisting of the required marginal distribution.

multiInf

Multiinformation

Description

Get the multiinformation for a discrete distribution

Usage

```
multiInf(x, ...)  
  
## Default S3 method:  
multiInf(x, margin = NULL, ...)  
  
## S3 method for class 'tables'  
multiInf(x, margin = NULL, ...)
```

Arguments

x	vectors (of probabilities)
...	other arguments to methods
margin	margin to find multiinformation for

Value

a numeric value, vector or matrix of required multiinformation.

Methods (by class)

- default: Default method for vectors and arrays
- tables: Method for tables object

mutualInf*(Conditional) mutual information*

Description

(Conditional) mutual information

Usage

```
mutualInf(p, m1, m2, condition, ...)

## Default S3 method:
mutualInf(p, m1, m2, condition, ...)

## S3 method for class 'tables'
mutualInf(p, m1, m2, condition, ...)
```

Arguments

p	numeric array or tables class
m1, m2	margins for mutual information
condition	conditional margin
...	other arguments to methods

Value

Numeric value for mutual information, or a vector of mutual information values.

Methods (by class)

- default: Default method for vectors
- tables: Method for tables object

ntables	<i>Number of tables</i>
---------	-------------------------

Description

Number of tables

Usage

```
ntables(x)
```

Arguments

x	an object of class tables
---	---------------------------

Details

Gives the number of tables in an object of class tables.

Value

An integer.

perm_dim	<i>Permute indices for variable k</i>
----------	---------------------------------------

Description

Currently only works for binary dimensions.

Usage

```
perm_dim(x, k, perm, ...)
```

Arguments

x	array or related object
k	index to permute
perm	permutation to perform
...	other arguments (not currently used)

Details

Permutes the levels of one variable according to the permutation given in perm. Can be applied to matrices, arrays or tables.

Value

A permuted array or tables object.

print.tables	<i>Print tables</i>
--------------	---------------------

Description

Print method for object of class tables.

Usage

```
## S3 method for class 'tables'
print(x, ...)
```

Arguments

x	object of class tables
...	arguments to pass to print method for an array

Value

The input provided (invisibly).

repTables	<i>Turn distributions into tables</i>
-----------	---------------------------------------

Description

Turn distributions into tables

Usage

```
repTables(n, f, ...)
```

Arguments

n	number of distributions to generate
f	function that generates a probability distribution
...	arguments to f

Value

a tables object containing the outputs of f

rprobMat	<i>Generate matrix of (conditional) probability distributions</i>
----------	---

Description

Generates discrete probability distributions in a matrix.

Usage

```
rprobMat(n, dim, d, alpha = 1)
rcondProbMat(n, dim, d, alpha = 1, condition)
```

Arguments

n	number of distributions
dim	dimension of contingency table for distributions
d	number of dimensions of table
alpha	parameter to use in dirichlet distribution
condition	which dimensions should be conditioned upon

Details

Returns an object of class `tables` consisting of discrete probability distributions. Each distribution is assumed to be a contingency table of dimension `dim`, and the probabilities are generated using a Dirichlet distribution with parameters all equal to `alpha`.

Value

A `tables` object containing random distributions.

Functions

- `rcondProbMat`: Random conditional distributions

Examples

```
dat <- rprobMat(10, c(2,2,2))
```

<code>tables</code>	<i>Create blank tables</i>
---------------------	----------------------------

Description

Create blank tables

Usage

```
tables(n, tdim)
```

Arguments

<code>n</code>	number of tables
<code>tdim</code>	dimension of each table

<code>tdim</code>	<i>Dimension of distributions over contingency tables</i>
-------------------	---

Description

Dimension of distributions over contingency tables

Usage

```
tdim(x)
```

```
tdim(x) <- value
```

Arguments

x an object of class tables
value value to set parameters to

Details

The class tables is used to represent a collection of multidimensional tables; this function returns the dimension of each table.

Value

an integer vector of the dimensions
the tables object inputted with the new dimensions

Functions

- tdim<-: assign tables dimension

tdimnames	<i>Dimension names for distributions over contingency tables</i>
-----------	--

Description

Dimension names for distributions over contingency tables

Usage

```
tdimnames(x)  
tdimnames(x) <- value
```

Arguments

x tables object
value value to set dimension names to

Value

the tables object inputted with the new dimension names

Functions

- tdimnames<-: assign dimension names

[.tables]

*Subset object of class tables***Description**

Take subset of tables class.

Usage

```
## S3 method for class 'tables'
x[i, j, ..., drop = TRUE, keep = FALSE]
```

Arguments

x	object of class tables
i	indices of which tables to retain
j	which rows of each table to retain (or if . . . not specified, entries)
...	additional indices up to the dimension of the table
drop	usual logical indicating whether to consolidate margins of the table (doesn't apply to i)
keep	if only one table is specified with i, should the object output be an object of class tables? If not becomes a suitable array.

Details

There are two main ways to subset these tables. In both cases the first index refers to the tables being selected; one of the methods is to additionally specify all the indices corresponding to the tables, the other is to only specify a single entry. For example, `x[, 1, 2, 2]` specifies the (1,2,2)th entry of each table; `x[, 7]` will have the same effect for 2x2x2 tables.

If only one index is specified, then the function behaves just as ordinary subsetting on an array.

Value

A tables object over the specific entries and values selected.

Examples

```
x <- rprobMat(n=10, rep(2,3))
x[1,]
x[, 1, 1:2, 1]
x[, 1, 1:2, 1, drop=FALSE]
```
