Package 'ggmap'

September 11, 2025

Version 4.0.2

Title Spatial Visualization with ggplot2

Description A collection of functions to visualize spatial data and models on top of static maps from various online sources (e.g Google Maps and Stamen Maps). It includes tools common to those tasks, including functions for geolocation and routing.

URL https://github.com/dkahle/ggmap

BugReports https://github.com/dkahle/ggmap/issues

Depends R (>= 3.1.0), ggplot2 (>= 2.2.0)

Imports png, plyr, jpeg, digest, scales, dplyr, bitops, grid, glue, httr, stringr, purrr, magrittr, tibble, tidyr, rlang, cli

Suggests MASS, hexbin, testthat

License GPL-2

LazyData true

RoxygenNote 7.3.2

Encoding UTF-8

NeedsCompilation no

bb2bbox *Convert a bb specification to a bbox specification*

Description

In ggmap, all maps (class ggmap) have the bb attribute, a data frame bounding box specification in terms of the bottom left and top right points of the spatial extent. This function converts this specification to a named double vector (with names left, bottom, right, top) specification that is used in some querying functions (e.g. get_stadiamap).

Usage

```
bb2bbox(bb)
```

Arguments

bb	a bounding box in bb format (see examples)

Value

a bounding box in bbox format (see examples)

Author(s)

David Kahle <david@kahle.io>

Examples

```
## Not run: # cut down on R CMD check time

# grab a center/zoom map and compute its bounding box
gc <- geocode("white house, washington dc")
map <- get_map(gc)
(bb <- attr(map, "bb"))
(bbox <- bb2bbox(bb))

# use the bounding box to get a Stadia map
stadMap <- get_stadiamap(bbox)

ggmap(map) +
  geom_point(
    aes(x = lon, y = lat),
    data = gc, colour = "red", size = 3
  )

ggmap(stadMap) +
  geom_point(
    aes(x = lon, y = lat),
    data = gc, colour = "red", size = 3
  )

## End(Not run)
```

calc_zoom *Calculate a zoom given a bounding box*

Description

calc_zoom can calculate a zoom based on either (1) a data frame with longitude and latitude variables, (2) a longitude range and latitude range, or (3) a bounding box (bbox specification). The specification for (1) is identical to that of most R functions, for (2) simply put in a longitude range into lon and a latitude range into lat, and for (3) put the bounding box in for the lon argument.

Usage

```
calc_zoom(lon, lat, data, adjust = 0, f = 0.05)
```

Arguments

lon	longitude, see details
lat	latitude, see details
data	(optional) a data frame containing lon and lat as variables
adjust	number to add to the calculated zoom
f	argument to pass to make_bbox

See Also

make_bbox(), bb2bbox()

Examples

```
# From data
calc_zoom(lon, lat, wind)

# From range
lon_range <- extendrange( wind$lon )
lat_range <- extendrange( wind$lat )
calc_zoom(lon_range, lat_range)

# From bounding box
box <- make_bbox(lon, lat, data = crime)
calc_zoom(box)
```

crime *Crime data*

Description

Lightly cleaned Houston crime from January 2010 to August 2010 geocoded with Google Maps

Author(s)

Houston Police Department, City of Houston

References

https://www.houstontx.gov/police/cs/index-2.htm

geocode *Geocode*

Description

Geocodes (finds latitude and longitude of) a location using the Google Geocoding API. Note: To use Google's Geocoding API, you must first enable the API in the Google Cloud Platform Console. See register_google().

Usage

```
geocode(
  location,
  output = c("latlon", "latlona", "more", "all"),
  source = c("google", "dsk"),
  force = ifelse(source == "dsk", FALSE, TRUE),
  urlonly = FALSE,
  override_limit = FALSE,
  nameType = c("long", "short"),
  ext = "com",
  inject = "",
  ...
)

mutate_geocode(data, location, ...)

geocodeQueryCheck()

geocode_cache()
```

```
write_geocode_cache(path, ...)

load_geocode_cache(path, overwrite = FALSE)

clear_geocode_cache(path)
```

Arguments

location	a character vector of street addresses or place names (e.g. "1600 pennsylvania avenue, washington dc
output	amount of output, "latlon", "latlona", "more", or "all"
source	"google" for Google (note: "dsk" is defunct)
force	force online query even if cached.
urlonly	return only the url?
override_limit	override the current query rate
nameType	in some cases, Google returns both a long name and a short name. this parameter allows the user to specify which to grab.
ext	top level domain (e.g. "com", "co.nz"); helpful for non-US users
inject	character string to add to the url or named character vector of key-value pairs to be injected (e.g. c("a" = "b") get converted to "a=b" and appended to the query)
...	In mutate_geocode(), arguments to pass to geocode(). In write_geocode_cache(), arguments to pass to saveRDS().
data	a data frame or equivalent
path	path to file
overwrite	in load_geocode_cache(), should the current cache be wholly replaced with the one on file?

Details

Note: geocode() uses Google's Geocoding API to geocode addresses. Please take care not to disclose sensitive information. https://pmc.ncbi.nlm.nih.gov/articles/PMC8972108/ suggest various alternative options for such data.

Value

If output is "latlon", "latlona", or "more", a tibble (classed data frame). If "all", a list.

Author(s)

David Kahle <david@kahle.io>

Examples

```
## Not run:  requires Google API key, see ?register_google

## basic usage
#########################################

# geocoding is most commonly used for addresses
geocode("1600 Amphitheatre Parkway, Mountain View, CA")
geocode("1600 Amphitheatre Parkway, Mountain View, CA", urlonly = TRUE)

# google can also geocode colloquial names of places
geocode("the white house")

# geocode can also accept character vectors of places
geocode(c("the white house", "washington dc"))

## types of output
#########################################

geocode("waco texas")
geocode("waco texas", output = "latlona")
geocode("waco texas", output = "more")
str(geocode("waco texas", output = "all"))

geocode(c("waco, texas", "houston, texas"))
geocode(c("waco, texas", "houston, texas"), output = "latlona")
geocode(c("waco, texas", "houston, texas"), output = "all") %>% str(4)

## mutate_geocode
#########################################

# mutate_geocode is used to add location columns to an existing dataset
# that has location information

df <- data.frame(
  address = c("1600 Pennsylvania Avenue, Washington DC", "", "houston texas"),
  stringsAsFactors = FALSE
)

mutate_geocode(df, address)
df %>% mutate_geocode(address)

## known issues
#########################################

# in some cases geocode finds several locations
```

```
## End(Not run)
```

`geom_leg` *Single line segments with rounded ends*

Description

This is ggplot2's segment with rounded ends. It's mainly included in ggmap for historical reasons.

Usage

```
geom_leg(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  arrow = NULL,
  lineend = "round",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)
```

Arguments

`mapping`	Set of aesthetic mappings created by `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.
`data`	The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A `function` will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A `function` can be created from a `formula` (e.g. `~ head(.x, 10)`).
`stat`	The statistical transformation to use on the data for this layer. When using a `geom_*()` function to construct a layer, the `stat` argument can be used to override the default coupling between geoms and stats. The `stat` argument accepts the following:

- A `Stat` ggproto subclass, for example `StatCount`.
- A string naming the stat. To give the stat as a string, strip the function name of the `stat_` prefix. For example, to use `stat_count()`, give the stat as `"count"`.
- For more information and other ways to specify the stat, see the layer stat documentation.

`position` A position adjustment to use on the data for this layer. This can be used in various ways, including to prevent overplotting and improving the display. The `position` argument accepts the following:

- The result of calling a position function, such as `position_jitter()`. This method allows for passing extra arguments to the position.
- A string naming the position adjustment. To give the position as a string, strip the function name of the `position_` prefix. For example, to use `position_jitter()`, give the position as `"jitter"`.
- For more information and other ways to specify the position, see the layer position documentation.

`arrow` specification for arrow heads, as created by `grid::arrow()`.

`lineend` Line end style (round, butt, square).

`na.rm` If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, missing values are silently removed.

`show.legend` logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display. To include legend keys for all levels, even when no data exists, use `TRUE`. If `NA`, all levels are shown in legend, but unobserved levels are omitted.

`inherit.aes` If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. `annotation_borders()`.

`...` Other arguments passed on to `layer()`'s `params` argument. These arguments broadly fall into one of 4 categories below. Notably, further arguments to the `position` argument, or aesthetics that are required can *not* be passed through `....` Unknown arguments that are not part of the 4 categories below are ignored.

- Static aesthetics that are not mapped to a scale, but are at a fixed value and apply to the layer as a whole. For example, `colour = "red"` or `linewidth = 3`. The geom's documentation has an **Aesthetics** section that lists the available options. The 'required' aesthetics cannot be passed on to the `params`. Please note that while passing unmapped aesthetics as vectors is technically possible, the order and required length is not guaranteed to be parallel to the input data.
- When constructing a layer using a `stat_*()` function, the `...` argument can be used to pass on parameters to the `geom` part of the layer. An example of this is `stat_density(geom = "area", outline.type = "both")`. The geom's documentation lists which parameters it can accept.
- Inversely, when constructing a layer using a `geom_*()` function, the `...` argument can be used to pass on parameters to the `stat` part of the layer.

An example of this is `geom_area(stat = "density", adjust = 0.5)`. The stat's documentation lists which parameters it can accept.

- The `key_glyph` argument of `layer()` may also be passed on through `...`. This can be one of the functions described as key glyphs, to change the display of the layer in the legend.

Details

only intended for use in ggmap package. only designed for mercator projection.

See Also

`ggplot2::geom_segment()`, `route()`, inspired by `https://spatialanalysis.co.uk/2012/02/great-maps-ggplot2`, no longer active

Examples

```
## Not run:  # removed for R CMD check speed

map <- get_map(
  location = c(-77.0425, 38.8925), # painfully picked by hand
  source = "google", zoom = 14, maptype = "satellite"
)
ggmap(map)

(legs_df <- route(
  "the white house, dc",
  "lincoln memorial washington dc",
  alternatives = TRUE
))

ggplot(data = legs_df) +
  geom_leg(aes(
    x = start_lon, xend = end_lon,
    y = start_lat, yend = end_lat
  )) +
  coord_map()

ggplot(data = legs_df) +
  geom_leg(aes(
    x = start_lon, xend = end_lon,
    y = start_lat, yend = end_lat,
    color = route
  )) +
  coord_map()

ggmap(map) +
  geom_leg(
    aes(
      x = start_lon, xend = end_lon,
```

```
      y = start_lat, yend = end_lat
    ),
    data = legs_df, color = "red"
  )

# adding a color aesthetic errors because of a base-layer problem
# ggmap(map) +
#   geom_leg(
#     aes(
#       x = start_lon, xend = end_lon,
#       y = start_lat, yend = end_lat,
#       color = route
#   )
# )

# this is probably the easiest hack to fix it
ggplot(data = legs_df) +
  inset_ggmap(map) +
  geom_leg(
    aes(
      x = start_lon, xend = end_lon,
      y = start_lat, yend = end_lat,
      color = route
    ),
    data = legs_df
  ) +
  coord_map()

## End(Not run)
```

`get_cloudmademap` *Get a CloudMade map.*

Description

`get_cloudmademap()` accesses a tile server for Stamen Maps and downloads/stitches map tiles/formats a map image. This function requires an api key which can be obtained for free from http://cloudmade.com/user/show, now defunct. Thousands of maptypes ("styles"), including create-your-own options, are available from http://maps.cloudmade.com/editor (defunct).

Usage

```
get_cloudmademap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
  zoom = 10,
  api_key,
  maptype = 1,
```

```
  highres = TRUE,
  crop = TRUE,
  messaging = FALSE,
  urlonly = FALSE,
  filename = NULL,
  color = c("color", "bw"),
  ...
)
```

Arguments

bbox	a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).
zoom	a zoom level
api_key	character string containing cloud made api key, see details
maptype	an integer of what cloud made calls style, see details
highres	double resolution
crop	crop raw map tiles to specified bounding box
messaging	turn messaging on/off
urlonly	return url only
filename	destination file for download (file extension added according to format). Default NULL means a random tempfile().
color	color or black-and-white
...	...

Value

a ggmap object (a classed raster object with a bounding box attribute)

Author(s)

David Kahle <david@kahle.io>

See Also

http://maps.cloudmade.com/ (defunct), ggmap()

get_googlemap *Get a Google Map.*

Description

get_googlemap() queries the Google Maps Static API version 2 to download a static map. Note that in most cases by using this function you are agreeing to the Google Maps API Terms of Service at https://cloud.google.com/maps-platform/terms. Note that as of mid-2018, registering with Google Cloud to obtain an API key is required to use any of Google's services, including get_googlemap(). Usage and billing may apply, see the links under See Also further down in this documentation for more details.

Usage

```
get_googlemap(
  center = c(lon = -95.3632715, lat = 29.7632836),
  zoom = 10,
  size = c(640, 640),
  scale = 2,
  format = c("png8", "gif", "jpg", "jpg-baseline", "png32"),
  maptype = GOOGLE_VALID_MAP_TYPES,
  language = "en-EN",
  messaging = FALSE,
  urlonly = FALSE,
  filename = NULL,
  color = c("color", "bw"),
  force = FALSE,
  where = tempdir(),
  archiving = FALSE,
  ext = "com",
  inject = "",
  region,
  markers,
  path,
  visible,
  style,
  ...
)
```

Arguments

center	the center of the map; either a longitude/latitude numeric vector or a string containing a location, in which case geocode() is called with source = "google". (default: c(lon = -95.3632715, lat = 29.7632836), a reference to Houston, Texas)
zoom	map zoom; an integer from 3 (continent) to 21 (building), default value 10 (city)

size	rectangular dimensions of map in pixels - horizontal x vertical - with a max of c(640, 640). this parameter is affected in a multiplicative way by scale.
scale	multiplicative factor for the number of pixels returned possible values are 1, 2, or 4 (e.g. size = c(640,640) and scale = 2 returns an image with 1280x1280 pixels). 4 is reserved for google business users only. scale also affects the size of labels as well.
format	character string providing image format - png, jpeg, and gif formats available in various flavors
maptype	character string providing google map theme. options available are "terrain", "satellite", "roadmap", and "hybrid"
language	character string providing language of map labels (for themes with them) in the format "en-EN". not all languages are supported; for those which aren't the default language is used
messaging	turn messaging on/off
urlonly	return url only
filename	destination file for download (file extension added according to format). Default NULL means a random tempfile().
color	color or black-and-white
force	if the map is on file, should a new map be looked up?
where	where should the file drawer be located (without terminating "/")
archiving	use archived maps. note: by changing to TRUE you agree to the one of the approved uses listed in the Google Maps API Terms of Service : https://cloud.google.com/maps-platform/terms.
ext	domain extension (e.g. "com", "co.nz")
inject	character string to add to the url
region	borders to display as a region code specified as a two-character ccTLD ("top-level domain") value, see https://en.wikipedia.org/wiki/List_of_Internet_top-level_domains#Country_code_top-level_domains
markers	data.frame with first column longitude, second column latitude, for which google markers should be embedded in the map image, or character string to be passed directly to api
path	data.frame (or list of data.frames) with first column longitude, second column latitude, for which a single path should be embedded in the map image, or character string to be passed directly to api
visible	a location as a longitude/latitude numeric vector (or data frame with first column longitude, second latitude) or vector of character string addresses which should be visible in map extent
style	character string to be supplied directly to the api for the style argument or a named vector (see examples). this is a powerful complex specification, see https://developers.google.com/maps/documentation/maps-static/
...	...

Value

a ggmap object (a classed raster object with a bounding box attribute)

Author(s)

David Kahle <david@kahle.io>

Examples

```
## Not run:  requires Google API key, see ?register_google

## basic usage
#########################################

(map <- get_googlemap(c(-97.14667, 31.5493)))
ggmap(map)

# plotting based on a colloquial name
# this requires a geocode() call, and needs that API
get_googlemap("waco, texas") %>% ggmap()

# different maptypes are available
get_googlemap("waco, texas", maptype = "satellite") %>% ggmap()
get_googlemap("waco, texas", maptype = "hybrid") %>% ggmap()

# you can get the url as follows
# see ?register_google if you want the key printed
get_googlemap(urlonly = TRUE)

## other usage
#########################################

# markers and paths are easy to access
d <- function(x=-95.36, y=29.76, n,r,a){
  round(data.frame(
    lon = jitter(rep(x,n), amount = a),
    lat = jitter(rep(y,n), amount = a)
  ), digits = r)
}
(df <- d(n = 50, r = 3, a = .3))
map <- get_googlemap(markers = df, path = df, scale = 2)
ggmap(map)
ggmap(map, extent = "device") +
  geom_point(aes(x = lon, y = lat), data = df, size = 3, colour = "black") +
```

```
  geom_path(aes(x = lon, y = lat), data = df)

gc <- geocode("waco, texas", source = "google")
center <- as.numeric(gc)
ggmap(get_googlemap(center = center, color = "bw", scale = 2), extent = "device")

# the scale argument can be seen in the following
# (make your graphics device as large as possible)
ggmap(get_googlemap(center, scale = 1), extent = "panel") # pixelated
ggmap(get_googlemap(center, scale = 2), extent = "panel") # fine

# archiving; note that you must meet google's terms for this condition
map <- get_googlemap(archiving = TRUE)
map <- get_googlemap()
map <- get_googlemap()
ggmap(map)

# style
map <- get_googlemap(
  maptype = "roadmap",
  style = c(feature = "all", element = "labels", visibility = "off"),
  color = "bw"
)
ggmap(map)

## End(Not run)
```

---

get_map *Grab a map.*

Description

get_map() is a smart wrapper that queries the Google Maps, OpenStreetMap, and Stadia Maps servers for a map.

Usage

```
get_map(
  location = c(lon = -95.3632715, lat = 29.7632836),
  zoom = "auto",
  scale = "auto",
  maptype = c(GOOGLE_VALID_MAP_TYPES, STADIA_VALID_MAP_TYPES),
  source = c("google", "osm", "stadia"),
  force = ifelse(source == "google", TRUE, FALSE),
```

```
  messaging = FALSE,
  urlonly = FALSE,
  filename = NULL,
  crop = TRUE,
  color = c("color", "bw"),
  language = "en-EN",
  ...
)
```

Arguments

location	an address, longitude/latitude pair (in that order), or left/bottom/right/top bounding box
zoom	map zoom, an integer from 3 (continent) to 21 (building), default value 10 (city). openstreetmaps limits a zoom of 18, and the limit on Stadia Maps depends on the maptype. "auto" automatically determines the zoom for bounding box specifications, and is defaulted to 10 with center/zoom specifications. maps of the whole world currently not supported.
scale	scale argument of `get_googlemap()` or `get_openstreetmap()`
maptype	character string providing map theme. options available are "terrain", "terrain-background", "satellite", "roadmap", and "hybrid" (Google Maps), "stamen_terrain", "stamen_toner", "stamen_toner_lite", "stamen_watercolor", "stamen_terrain_background", "stamen_toner_background", "stamen_terrain_lines", "stamen_terrain_labels", "stamen_toner_lines", "stamen_toner_labels" (Stadia Maps)
source	Google Maps ("google"), OpenStreetMap ("osm"), Stadia Maps ("stadia")
force	force new map (don't use archived version)
messaging	turn messaging on/off
urlonly	return url only
filename	destination file for download (file extension added according to format). Default `NULL` means a random `tempfile()`.
crop	(Stadia and cloudmade maps) crop tiles to bounding box
color	color ("color") or black-and-white ("bw")
language	language for google maps
...	...

Value

a ggmap object (a classed raster object with a bounding box attribute)

Author(s)

David Kahle <david@kahle.io>

See Also

`ggmap()`

Examples

```
## Not run:  some requires Google API key, see ?register_google

## basic usage
########################################

# lon-lat vectors automatically use google:
(map <- get_map(c(-97.14667, 31.5493)))
str(map)
ggmap(map)

# bounding boxes default to Stadia Maps
(map <- get_map(c(left = -97.1268, bottom = 31.536245, right = -97.099334, top = 31.559652)))
ggmap(map)

# characters default to google
(map <- get_map("orlando, florida"))
ggmap(map)

## basic usage
########################################

(map <- get_map(maptype = "roadmap"))
(map <- get_map(source = "osm"))
(map <- get_map(source = "stadia", maptype = "stamen_watercolor"))

map <- get_map(location = "texas", zoom = 6, source = "stadia")
ggmap(map, fullpage = TRUE)

## End(Not run)
```

`get_navermap` *Get a Naver Map*

Description

This is (at least) temporarily unavailable as the Naver API changed.

Usage

```
get_navermap(
  center = c(lon = 126.9849208, lat = 37.5664519),
  zoom = 4,
  size = c(640, 640),
  format = c("png", "jpeg", "jpg"),
 crs = c("EPSG:4326", "NHN:2048", "NHN:128", "EPSG:4258", "EPSG:4162", "EPSG:2096",
    "EPSG:2097", "EPSG:2098", "EPSG:900913"),
```

```
  baselayer = c("default", "satellite"),
  color = c("color", "bw"),
  overlayers = c("anno_satellite", "bicycle", "roadview", "traffic"),
  markers,
  key,
  uri,
  filename = NULL,
  messaging = FALSE,
  urlonly = FALSE,
  force = FALSE,
  where = tempdir(),
  archiving = TRUE,
  ...
)
```

Arguments

center	the center of the map. this can be longitude/latitude numeric vector.
zoom	map zoom, an integer from 1 to 14 (building), default value 10
size	rectangular dimensions of map in pixels - horizontal x vertical - with a max of c(640, 640).
format	character string providing image format - png, jpeg(jpg) formats available in various flavors
crs	Coordinate system, this currently supports EPSG:4326
baselayer	base layer, this can be either "default", "satellite".
color	color or black-and-white
overlayers	overlay layers, this can be "anno_satellite","bicycle", "roadview", "traffic".
markers	data.frame with first column longitude, second column latitude, for which naver markers should be embedded in the map image, or character string to be passed directly to api
key	key code from naver api center
uri	registered host url
filename	destination file for download (file extension added according to format). Default NULL means a random tempfile().
messaging	turn messaging on/off
urlonly	return url only
force	if the map is on file, should a new map be looked up?
where	where should the file drawer be located (without terminating "/")
archiving	use archived maps. note: by changing to TRUE you agree to abide by any of the rules governing caching naver maps
...	...

Details

get_navermap() accesses the Naver Static Maps API version 1.1 to download a static map. Note that in most cases by using this function you are agreeing to the Naver Maps API Terms of Service.

get_openstreetmap *Get an OpenStreetMap*

Description

get_openstreetmap() accesses a tile server for OpenStreetMap and downloads/formats a map image. This is simply a wrapper for the web-based version at https://www.openstreetmap.org/. If you don't know how to get the map you want, go there, navigate to the map extent that you want, click the export tab at the top of the page, and copy the information into this function.

Usage

```
get_openstreetmap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
  scale = 606250,
  format = c("png", "jpeg", "svg", "pdf", "ps"),
  messaging = FALSE,
  urlonly = FALSE,
  filename = NULL,
  color = c("color", "bw"),
  ...
)
```

Arguments

bbox	a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat)
scale	scale parameter, see https://wiki.openstreetmap.org/wiki/MinScaleDenominator. smaller scales provide a finer degree of detail, where larger scales produce more coarse detail. The scale argument is a tricky number to correctly specify. In most cases, if you get an error when downloading an openstreetmap the error is attributable to an improper scale specification. OSM_scale_lookup() can help; but the best way to get in the correct range is to go to https://www.openstreetmap.org/, navigate to the map of interest, click export at the top of the page, click 'map image' and then copy down the scale listed.

format	character string providing image format - png, jpeg, svg, pdf, and ps formats
messaging	turn messaging on/off
urlonly	return url only
filename	destination file for download (file extension added according to format). Default NULL means a random tempfile().
color	color or black-and-white
...	...

Details

In some cases the OSM server is unavailable, in these cases you will receive an error message from utils::download.file() with the message HTTP status '503 Service Unavailable'. You can confirm this by setting urlonly = TRUE, and then entering the URL in a web browser. the solution is either (1) change sources or (2) wait for the OSM servers to come back up.

See https://www.openstreetmap.org/copyright/ for license and copyright information.

Value

a ggmap object (a classed raster object with a bounding box attribute)

get_stadiamap *Get a Map from Stadia Maps*

Description

get_stadiamap() accesses a tile server for Stadia Maps and downloads/stitches map tiles/formats a map image.

Usage

```
get_stadiamap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
  zoom = 10,
  maptype = STADIA_VALID_MAP_TYPES,
  crop = TRUE,
  messaging = FALSE,
  urlonly = FALSE,
  color = c("color", "bw"),
```

```
  force = FALSE,
  where = tempdir(),
  ...
)
```

Arguments

bbox	a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).
zoom	a zoom level
maptype	stamen_terrain, stamen_toner, stamen_toner_lite, stamen_watercolor, stamen_terrain_background, stamen_toner_background, stamen_terrain_lines, stamen_terrain_labels, stamen_toner_lines, stamen_toner_labels.
crop	crop raw map tiles to specified bounding box. if FALSE, the resulting map will more than cover the bounding box specified.
messaging	turn messaging on/off
urlonly	return url only
color	color or black-and-white (use force = TRUE if you've already downloaded the images)
force	if the map is on file, should a new map be looked up?
where	where should the file drawer be located (without terminating "/")
...	...

Value

a ggmap object (a classed raster object with a bounding box attribute)

# continental united states labels
c("left" = -125, "bottom" = 25.75, "right" = -67, "top" = 49) %>%
  get_stadiamap(zoom = 5, maptype = "stamen_toner_labels") %>%
  ggmap()

# accuracy check - white house
gc <- geocode("the white house")

qmap("the white house", zoom = 16)  +
  geom_point(aes(x = lon, y = lat), data = gc, colour = "red", size = 3)

qmap("the white house", zoom = 16, source = "stadia", maptype = "stamen_terrain")  +
  geom_point(aes(x = lon, y = lat), data = gc, colour = "red", size = 3)

## known issues
########################################

# Stamen's original tilesets were raster renders built up over time, but have not been
# actively rendered for several years. As a consequence, some tiles simply do not exist,
# particularly at high zoom levels.
#
# The newer styles have been redesigned and are now generated live by Stadia Maps, so
# these are complete, but at the time of this writing, the Watercolor style is still incomplete.

## End(Not run)
```

`get_stamenmap` *Get a Stamen Map*

Description

`get_stamenmap()` accesses a tile server for Stamen Maps and downloads/stitches map tiles/formats a map image. Note that Stamen maps don't cover the entire world.

Usage

```
get_stamenmap(
  bbox = c(left = -95.80204, bottom = 29.38048, right = -94.92313, top = 30.14344),
   zoom = 10,
  maptype = c("terrain", "terrain-background", "terrain-labels", "terrain-lines",
     "toner", "toner-2010", "toner-2011", "toner-background", "toner-hybrid",
```

```
    "toner-labels", "toner-lines", "toner-lite", "watercolor"),
  crop = TRUE,
  messaging = FALSE,
  urlonly = FALSE,
  color = c("color", "bw"),
  force = FALSE,
  where = tempdir(),
  https = FALSE,
  ...
)

get_stamen_tile_download_fail_log()

retry_stamen_map_download()
```

Arguments

bbox	a bounding box in the format c(lowerleftlon, lowerleftlat, upperrightlon, upperrightlat).
zoom	a zoom level
maptype	terrain, terrain-background, terrain-labels, terrain-lines, toner, toner-2010, toner-2011, toner-background, toner-hybrid, toner-labels, toner-lines, toner-lite, or watercolor.
crop	crop raw map tiles to specified bounding box. if FALSE, the resulting map will more than cover the bounding box specified.
messaging	turn messaging on/off
urlonly	return url only
color	color or black-and-white (use force = TRUE if you've already downloaded the images)
force	if the map is on file, should a new map be looked up?
where	where should the file drawer be located (without terminating "/")
https	if TRUE, queries an https endpoint so that web traffic between you and the tile server is ecrypted using SSL.
...	...

Value

a ggmap object (a classed raster object with a bounding box attribute)

See Also

ggmap()

ggimage *Plot an image using ggplot2*

Description

ggimage is the near ggplot2 equivalent of image.

Usage

```
ggimage(mat, fullpage = TRUE, coord_equal = TRUE, scale_axes = FALSE)
```

Arguments

mat	a matrix, imagematrix, array, or raster (something that can be coerced by as.raster)
fullpage	should the image take up the entire viewport?
coord_equal	should the axes units be equal?
scale_axes	should the axes be (0,ncol(mat)-1)x(0,nrow(mat)-1) (F) or (0,1)x(0,1) (T)

Value

a ggplot object

Author(s)

David Kahle <david@kahle.io>

Examples

```
img <- matrix(1:16, 4, 4)
image(img)
ggimage(t(img[,4:1]), fullpage = FALSE, scale_axes = TRUE)
ggimage(t(img[,4:1]), fullpage = FALSE)

## Not run:
# not run due to slow performance

data(hadley)
ggimage(hadley)
ggimage(hadley, coord_equal = FALSE)

x <- seq(1, 438, 15); n <- length(x)
df <- data.frame(x = x, y = -(120*(scale((x - 219)^3 - 25000*x) + rnorm(n)/2 - 3)))
qplot(x, y, data = df, geom = c('smooth','point'))
ggimage(hadley, fullpage = FALSE) +
  geom_smooth(
    aes(x = x, y = y),
    data = df, color = 'green', size = 1
```

```
  ) +
  geom_point(
    aes(x = x, y = y),
    data = df, color = 'green', size = 3
  )

## End(Not run)
```

---

gglocator *Locator for ggplot objects*

Description

Locator for ggplot objects (Note : only accurate when extent = "normal" when using ggmap.)

Usage

```
gglocator(n = 1, message = FALSE, mercator = TRUE, ...)
```

Arguments

n	number of points to locate.
message	unused
mercator	logical flag; should the plot be treated as using the projection common to most web map services? Set to FALSE if the axes on the plot use a linear scale.
...	additional arguments (including deprecated, e.g. xexpand)

Value

a data frame with columns according to the x and y aesthetics

Author(s)

Tyler Rinker, Baptiste Auguie, DWin, David Kahle, \@Nikolai-Hlubek and \@mvkorpel.

Examples

```
if (interactive()) {

# only run for interactive sessions
df <- expand.grid(x = 0:-5, y = 0:-5)

ggplot(df, aes(x, y)) + geom_point() +
  annotate(geom = "point", x = -2, y = -2, colour = "red")

(pt <- gglocator(mercator = FALSE)) # click red point
```

```
last_plot() +
  annotate("point", pt$x, pt$y, color = "blue", size = 3, alpha = .5)

hdf <- get_map("houston, texas")
ggmap(hdf, extent = "normal")
(pt <- gglocator(mercator = TRUE))
last_plot() +
  annotate("point", pt$lon, pt$lat, color = "blue", size = 3, alpha = .5)

}
```

---

ggmap *Plot a ggmap object*

Description

ggmap plots the raster object produced by `get_map()`.

Usage

```
ggmap(
  ggmap,
  extent = "panel",
  base_layer,
  maprange = FALSE,
  legend = "right",
  padding = 0.02,
  darken = c(0, "black"),
  b,
  fullpage,
  expand,
  ...
)
```

Arguments

ggmap	an object of class ggmap (from function get_map)
extent	how much of the plot should the map take up? "normal", "device", or "panel" (default)
base_layer	a ggplot(aes(...), ...) call; see examples
maprange	logical for use with base_layer; should the map define the x and y limits?
legend	"left", "right" (default), "bottom", "top", "bottomleft", "bottomright", "topleft", "topright", "none" (used with extent = "device")
padding	distance from legend to corner of the plot (used with legend, formerly b)

darken	vector of the form c(number, color), where number is in (0,1) and color is a character string indicating the color of the darken. 0 indicates no darkening, 1 indicates a black-out.
b	Deprecated, renamed to padding. Overrides any padding argument.
fullpage	Deprecated, equivalent to extent = "device" when TRUE. Overrides any extent argument.
expand	Deprecated, equivalent to extent = "panel" when TRUE and fullpage is FALSE. When fullpage is FALSE and expand is FALSE, equivalent to extent="normal". Overrides any extent argument.
...	...

Value

a ggplot object

Author(s)

David Kahle <david@kahle.io>

`ggmap-defunct` *Defunct ggmap functions*

Description

As provider services change over time, ggmap has to make corresponding changes. Since its inception, a few services have stopped offering their previous functionality, and in some cases this has required us to remove those functions from the package entirely.

Details

The following are defunct ggmap functions:

- get_cloudemademap
- get_navermap
- get_openstreetmap
- get_stamenmap

`ggmapplot` *Don't use this function, use ggmap.*

Description

ggmap plots the raster object produced by `get_map()`.

Usage

```
ggmapplot(
  ggmap,
  fullpage = FALSE,
  base_layer,
  maprange = FALSE,
  expand = FALSE,
  ...
)
```

Arguments

ggmap	an object of class ggmap (from function get_map())
fullpage	logical; should the map take up the entire viewport?
base_layer	a ggplot(aes(...), ...) call; see examples
maprange	logical for use with base_layer; should the map define the x and y limits?
expand	should the map extend to the edge of the panel? used with base_layer and maprange=TRUE.
...	...

Value

a ggplot object

Author(s)

David Kahle <david@kahle.io>

See Also

get_map(), qmap()

Examples

```
## Not run:
this is a deprecated function, use ggmap.

## End(Not run)
```

---

ggmap_options *ggmap Options*

Description

ggmap stores options as a named list in R's global options, i.e. getOption("ggmap"). It currently stores two such options, one for Google credentialing and one to suppress private API information in the URLs printed to the screen when web queries are placed. For both of those, see register_google().

Usage

```
set_ggmap_option(...)

has_ggmap_options()

has_ggmap_option(option)

ggmap_credentials()
```

Arguments

...	a named listing of options to set
option	a specific option to query, e.g. "display_api_key"

Author(s)

David Kahle <david@kahle.io>

See Also

register_google()

Examples

```
getOption("ggmap")
has_ggmap_options()
has_ggmap_option("display_api_key")
```

---

hadley *Highly unofficial ggplot2 image*

Description

Highly unofficial ggplot2 image

Author(s)

Garrett Grolemund <grolemund@gmail.com>

---

inset *Add ggplot2 insets to a map*

Description

This is identical to ggplot2::annotation_custom() for use with ggmap

Usage

```
inset(grob, xmin = -Inf, xmax = Inf, ymin = -Inf, ymax = Inf)
```

Arguments

grob	grob to display
xmin, xmax	x location (in data coordinates) giving horizontal location of raster
ymin, ymax	y location (in data coordinates) giving vertical location of raster

Details

Most useful for adding tables, inset plots, and other grid-based decorations

Note

annotation_custom() expects the grob to fill the entire viewport defined by xmin, xmax, ymin, ymax. Grobs with a different (absolute) size will be center-justified in that region. Inf values can be used to fill the full plot panel

---

inset_raster *Create a (ggplot2) raster layer*

Description

This is a special version of ggplot2::annotation_raster for use with ggmap. (It simply removes the requirement for cartesian coordinates.) The only difference between inset_raster() and inset_ggmap() is their arguments. inset_ggmap() is simply a wrapper of inset_raster() with xmin, ..., ymax arguments equal to the map's bounding box.

Usage

```
inset_raster(raster, xmin, xmax, ymin, ymax, interpolate = TRUE)

inset_ggmap(ggmap)
```

Arguments

raster	raster object to display
xmin, xmax	x location (in data coordinates) giving horizontal location of raster
ymin, ymax	y location (in data coordinates) giving vertical location of raster
interpolate	interpolate the raster? (i.e. antialiasing)
ggmap	a ggmap object, see get_map()

See Also

bb2bbox()

Examples

```
## Not run:  # save cran check time

ggmap(terrain_map) +
  inset_ggmap(lines_map)

## End(Not run)
```

---

legs2route *Convert a leg-structured route to a route-structured route*

Description

Convert a leg-structured route to a route-structured route

Usage

```
legs2route(legsdf)
```

Arguments

legsdf	a legs-structured route, see route()

See Also

ggplot2::geom_path()

Examples

```
## Not run:  requires Google API key, see ?register_google

(legs_df <- route("houston","galveston"))
legs2route(legs_df)

(legs_df <- route(
  "marrs mclean science, baylor university",
  "220 south 3rd street, waco, tx 76701", # ninfa"s
```

```
  alternatives = TRUE))

legs2route(legs_df)

from <- "houston, texas"
to <- "waco, texas"
legs_df <- route(from, to)

qmap("college station, texas", zoom = 8) +
  geom_segment(
    aes(x = start_lon, y = start_lat, xend = end_lon, yend = end_lat),
    colour = "red", size = 1.5, data = legs_df
  )
# notice boxy ends

qmap("college station, texas", zoom = 8) +
  geom_leg(
    aes(x = start_lon, y = start_lat, xend = end_lon, yend = end_lat),
    colour = "red", size = 1.5, data = legs_df
  )
# notice overshooting ends

route_df <- legs2route(legs_df)
qmap("college station, texas", zoom = 8) +
  geom_path(
    aes(x = lon, y = lat),
    colour = "red", size = 1.5, data = route_df, lineend = "round"
  )

## End(Not run)
```

LonLat2XY *Convert a lon/lat coordinate to a tile coordinate*

Description

Convert a lon/lat coordinate to a tile coordinate for a given zoom. Decimal tile coordinates (x, y) are reported.

Usage

```
LonLat2XY(lon_deg, lat_deg, zoom, xpix = 256, ypix = 256)
```

Arguments

lon_deg	longitude in degrees
lat_deg	latitude in degrees
zoom	zoom
xpix	width of tile in pixels
ypix	length of tile in pixels

Value

a data frame with columns X, Y, x, y

Author(s)

David Kahle <david@kahle.io>, based on RgoogleMaps::LatLon2XY() by Markus Loecher of Sense Networks <markus@sensenetworks.com>

See Also

https://wiki.openstreetmap.org/wiki/Slippy_map_tilenames

Examples

```
## Not run:
gc <- geocode('baylor university')
LonLat2XY(gc$lon, gc$lat, 10)

## End(Not run)
```

---

make_bbox *Compute a bounding box*

Description

Compute a bounding box for a given longitude / latitude collection.

Usage

```
make_bbox(lon, lat, data, f = 0.05)
```

Arguments

lon	longitude
lat	latitude
data	(optional) a data frame containing lon and lat as variables
f	number specifying the fraction by which the range should be extended. if length 2 vector, applies to longitude and then latitude.

Examples

```
make_bbox(lon, lat, data = crime)
make_bbox(lon, lat, data = crime, f = .20)
make_bbox(lon, lat, data = crime, f = c(.20, .05))

(lon <- sample(crime$lon, 10))
(lat <- sample(crime$lat, 10))
make_bbox(lon, lat)
make_bbox(lon, lat, f = .10) # bigger box
```

---

mapdist *Compute map distances using Google*

Description

Compute map distances using Google's Distance Matrix API. Note: To use Google's Distance Matrix API, you must first enable the API in the Google Cloud Platform Console. See register_google().

Usage

```
mapdist(
  from,
  to,
  mode = c("driving", "walking", "bicycling", "transit"),
  output = c("simple", "all"),
  urlonly = FALSE,
  override_limit = FALSE,
  ext = "com",
  inject = "",
  ...
)

distQueryCheck()
```

Arguments

from	name of origin addresses in a data frame (vector accepted), or a data frame with from and to columns
to	name of destination addresses in a data frame (vector accepted)
mode	driving, bicycling, walking, or transit
output	amount of output
urlonly	return only the url?
override_limit	override the current query count (.google_distance_query_times)
ext	top level domain domain extension (e.g. "com", "co.nz")
inject	character string to add to the url
...	...

Details

if parameters from and to are specified as geographic coordinates, they are reverse geocoded with revgeocode. note that the google maps api limits to 2500 element queries a day.

Value

a data frame (output="simple") or all of the geocoded information (output="all")

```
## End(Not run)
```

`OSM_scale_lookup` *Look up OpenStreetMap scale for a given zoom level.*

Description

Look up OpenStreetMap scale for a given zoom level.

Usage

```
OSM_scale_lookup(zoom = 10)
```

Arguments

`zoom`	google zoom

Details

The calculation of an appropriate OSM scale value for a given zoom level is a complicated task. For details, see https://wiki.openstreetmap.org/wiki/FAQ

Value

scale

Author(s)

David Kahle <david@kahle.io>

Examples

```
OSM_scale_lookup(zoom = 3)
OSM_scale_lookup(zoom = 10)

## Not run:
# these can take a long time or are prone to crashing
# if the osm server load is too high

# these maps are were the ones used to tailor fit the scale
# the zooms were fixed
ggmap(get_map(zoom =  3, source = 'osm', scale = 47500000), extent = "device")

qmap(lonR = lonR, latR = latR, source = 'osm', scale = 325E5)

## End(Not run)
```

`print.ggmap` *Print a map*

Description

Print a console description of a map

Usage

```
## S3 method for class 'ggmap'
print(x, ...)
```

Arguments

`x`	an object of class elicit
`...`	additional parameters

Value

Invisibly returns `x`.

Examples

```
## Not run:  requires a Stadia Maps API key. see ?register_stadiamaps

get_stadiamap(zoom = 9)
```

```
## End(Not run)
```

---

qmap *Quick map plot*

Description

qmap is a wrapper for ggmap() and get_map().

Usage

```
qmap(location = "houston", ...)
```

Arguments

location	character; location of interest
...	stuff to pass to ggmap() and get_map()

Value

a ggplot object

Author(s)

David Kahle <david@kahle.io>

See Also

ggmap() and get_map()

Examples

```
## Not run:  some requires Google API key; heavy network/time load

location <- "marrs mclean science, waco, texas"
qmap(location)
qmap(location, zoom = 14)
qmap(location, zoom = 14, source = "osm")
qmap(location, zoom = 14, source = "osm", scale = 20000)

qmap(location, zoom = 14, maptype = "stamen_terrain_background", source = "stadia")
qmap(location, zoom = 14, maptype = "stamen_toner_lite", source = "stadia")

where <- "the white house, washington dc"
```

```
wh <- geocode(where)
qmap(where, maprange = TRUE, zoom = 15,
  base_layer = ggplot(aes(x=lon, y=lat), data = wh)) +
  geom_point()

## End(Not run)
```

---

qmplot *Quick map plot*

Description

qmplot() is the ggmap equivalent to the ggplot2 function qplot and allows for the quick plotting of maps with data/models/etc.

Usage

```
qmplot(
  x,
  y,
  ...,
  data,
  zoom,
  source = "stadia",
  maptype = "stamen_toner_lite",
  extent = "device",
  legend = "right",
  padding = 0.02,
  force = FALSE,
  darken = c(0, "black"),
  mapcolor = "color",
  facets = NULL,
  margins = FALSE,
  geom = "auto",
  stat = list(NULL),
  position = list(NULL),
  xlim = c(NA, NA),
  ylim = c(NA, NA),
  main = NULL,
  f = 0.05,
  xlab = "Longitude",
  ylab = "Latitude"
)
```

Arguments

x	longitude values
y	latitude values
...	other aesthetics passed for each layer
data	data frame to use (optional). If not specified, will create one, extracting vectors from the current environment.
zoom	map zoom, see get_map()
source	map source, see get_map()
maptype	map type, see get_map()
extent	how much of the plot should the map take up? "normal", "panel", or "device" (default)
legend	"left", "right" (default), "bottom", "top", "bottomleft", "bottomright", "topleft", "topright", "none" (used with extent = "device")
padding	distance from legend to corner of the plot (used with extent = "device")
force	force new map (don't use archived version)
darken	vector of the form c(number, color), where number is in (0,1) and color is a character string indicating the color of the darken. 0 indicates no darkening, 1 indicates a black-out.
mapcolor	color ("color") or black-and-white ("bw")
facets	faceting formula to use. Picks ggplot2::facet_wrap() or ggplot2::facet_grid() depending on whether the formula is one sided or two-sided
margins	whether or not margins will be displayed
geom	character vector specifying geom to use. defaults to "point"
stat	character vector specifying statistics to use
position	character vector giving position adjustment to use
xlim	limits for x axis
ylim	limits for y axis
main	character vector or expression for plot title
f	number specifying the fraction by which the range should be extended
xlab	character vector or expression for x axis label
ylab	character vector or expression for y axis label

Examples

```
## Not run:  # these are skipped to conserve R check time

qmplot(lon, lat, data = crime)

# only violent crimes
violent_crimes <- subset(crime,
  offense != "auto theft" &
```

## End(Not run) # end dontrun
```

`register_google` *Register a Google API*

Description

This page contains documentation for tools related to enabling Google services in R. See the Details section of this file for background information.

Usage

```
showing_key()

ggmap_show_api_key()

ggmap_hide_api_key()

scrub_key(string, with = "xxx")

register_google(
  key,
  account_type,
  client,
  signature,
  second_limit,
  day_limit,
  write = FALSE
)

## S3 method for class 'google_credentials'
print(x, ...)

google_key()

has_google_key()

has_google_account()

google_account()

google_client()

has_google_client()

google_signature()

has_google_signature()

google_second_limit()

google_day_limit()
```

Arguments

string	a url string to be scrubbed. currently key, signature, and client keywords are scrubbed from the url and replace with the with argument
with	a string to replace
key	an api key
account_type	"standard" or "premium"
client	client code
signature	signature code
second_limit	query limit per second (default 50)
day_limit	query limit per day (default 2500 for standard accounts, 100000 for premium accounts)
write	if TRUE, stores the secrets provided in the .Renviron file
x	a google credentials class object
...	a dumped formal argument to the generic print method

Details

As of mid-2018, the Google Maps Platform requires a registered API key. While this alleviates previous burdens (e.g. query limits), it creates some challenges as well. The most immediate challenge for most R users is that ggmap functions that use Google's services no longer function out of the box, since the user has to setup an account with Google, enable the relevant APIs, and then tell R about the user's setup.

To obtain an API key and enable services, go to https://mapsplatform.google.com/. This documentation shows you how to input the requisite information (e.g. your API key) into R, and it also shows you a few tools that can help you work with the credentialing.

To tell ggmap about your API key, use register_google(), e.g. register_google(key = "mQkzTpiaLYjPqXQBotesgif3Ef
(that's a fake key). This will set your API key for the current session, but if you restart R, you'll need to do it again. You can set it permanently by setting write = TRUE, see the examples. If you set it permanently it will be stored in your .Renviron file, and that will be accessed by ggmap persistently across sessions.

Users should be aware that the API key, a string of jarbled characters/numbers/symbols, is a PRIVATE key - it uniquely identifies and authenticates you to Google's services. If anyone gets your API key, they can use it to masquerade as you to Google and potentially use services that you have enabled. Since Google requires a valid credit card to use its online cloud services, this also means that anyone who obtains your key can potentially make charges to your card in the form of Google services. So be sure to not share your API key. To mitigate against users inadvertently sharing their keys, by default ggmap never displays a user's key in messages displayed to the console.

Users should also be aware that ggmap has no mechanism with which to safeguard the private key once registered with R. That is to say, once you register your API key, any function R will have access to it. As a consequence, ggmap will not know if another function, potentially from a compromised package, accesses the key and uploads it to a third party. For this reason, when using ggmap we recommend a heightened sense of security and self-awareness: only use trusted packages, do not save API keys in script files, routinely cycle keys (regenerate new keys and retire old ones), etc. Google offers features to help in securing your API key, including things like limiting queries

using that key to a particular IP address, as well as guidance on security best practices. See https://cloud.google.com/docs/authentication/api-keys#securing_an_api_key for details.

register_stadiamaps *Register a Stadia Maps API Key*

Description

This page contains documentation for tools related to enabling Stadia Maps services in R. See the Details section of this file for background information.

Usage

```
register_stadiamaps(key, write = FALSE)

stadiamaps_key()

has_stadiamaps_key()
```

Arguments

key	an api key
write	if TRUE, stores the secrets provided in the .Renviron file

Details

To obtain an API key and enable services, go to https://client.stadiamaps.com/signup/. It is completely free for non-commercial and evaluation use (a license is for commercial use; see https://stadiamaps.com/pricing for pricing), and no credit card is required to sign up.

To tell ggmap about your API key, use register_stadiamaps(), e.g. register_stadiamaps(key = "YOUR-API-KEY") (that's a fake key). This will set your API key for the current session, but if you restart R, you'll need to do it again. You can set it permanently by setting write = TRUE, see the examples. If you set it permanently it will be stored in your .Renviron file, and that will be accessed by ggmap persistently across sessions.

Users should be aware that the API key, is a PRIVATE key - it uniquely identifies and authenticates you to Stadia Maps' services. If anyone gets your API key, they can use it to masquerade as you to Stadia Maps and potentially use services that you have enabled. While Stadia Maps requires you to opt in to additional usage-based billing, this also means that anyone who obtains your key can potentially incur charges on your behalf or steal the quota that you have already purchased. So be sure to not share your API key. To mitigate against users inadvertently sharing their keys, by default ggmap never displays a user's key in messages displayed to the console.

Users should also be aware that ggmap has no mechanism with which to safeguard the private key once registered with R. That is to say, once you register your API key, any function R will have access to it. As a consequence, ggmap will not know if another function, potentially from a compromised package, accesses the key and uploads it to a third party. For this reason, when using ggmap we recommend a heightened sense of security and self-awareness: only use trusted packages, do not save API keys in script files, routinely cycle keys (regenerate new keys and retire old ones), etc.

# this sets your Stadia Maps API key permanently
```

```
# register_stadiamaps(key = "YOUR-API-KEY", write = TRUE)

has_stadiamaps_key()
stadiamaps_key()
```

`revgeocode` *Reverse geocode*

Description

Reverse geocodes (looks up the address of) a longitude/latitude location using the Google Geocoding API. Note: To use Google's Geocoding API, you must first enable the API in the Google Cloud Platform Console. See `register_google()`.

Usage

```
revgeocode(
  location,
  output = c("address", "all"),
  force = FALSE,
  urlonly = FALSE,
  override_limit = FALSE,
  ext = "com",
  inject = "",
  ...
)
```

Arguments

`location`	a location in longitude/latitude format
`output`	"address" or "all"
`force`	force online query, even if cached (previously downloaded)
`urlonly`	return only the url?
`override_limit`	override the current query rate
`ext`	top level domain extension (e.g. "com", "co.nz")
`inject`	character string to add to the url
`...`	...

Value

a character(1) address or a list (the parsed json output from Google)

Author(s)

David Kahle <david@kahle.io>

See Also

Examples

```
## Not run:  requires Google API key, see ?register_google

## basic usage
########################################

( gc <- as.numeric(geocode("the white house")) )
revgeocode(gc)
str(revgeocode(gc, output = "all"), 3)

## End(Not run)
```

---

route *Grab a route from Google*

Description

Route two locations: determine a sequence of steps (legs) between two locations using the Google Directions API. Note: To use Google's Directions API, you must first enable the API in the Google Cloud Platform Console. See register_google().

Usage

```
route(
  from,
  to,
  mode = c("driving", "walking", "bicycling", "transit"),
  structure = c("legs", "route"),
  output = c("simple", "all"),
  alternatives = FALSE,
  units = "metric",
  urlonly = FALSE,
  override_limit = FALSE,
  ext = "com",
  inject = "",
  ...
)

routeQueryCheck()
```

Arguments

from	vector of origin addresses
to	vector of destination addresses
mode	driving, bicycling, walking, or transit
structure	structure of output, "legs" or "route", see examples
output	amount of output ("simple" or "all")
alternatives	should more than one route be provided?
units	"metric"
urlonly	return only the url?
override_limit	override the current query count
ext	domain extension (e.g. "com", "co.nz")
inject	character string to add to the url
...	...

Value

a data frame (output="simple") or all of the geocoded information (output="all")

Author(s)

David Kahle <david@kahle.io>

https://developers.google.com/maps/documentation/directions/, trek(), legs2route(), geom_leg(), register_google()

Examples

```
## Not run:  requires Google API key, see ?register_google

## basic usage
#########################################

from <- "houston, texas"
to <- "waco, texas"

route(from, to, structure = "legs")
route(from, to, structure = "route")

route(from, to, alternatives = TRUE)

## comparison to trek
#########################################
(route_df <- route(from, to, structure = "route"))
(trek_df  <-  trek(from, to, structure = "route"))
```

```
qmap("college station, texas", zoom = 8) +
  geom_path(
    aes(x = lon, y = lat),  colour = "red",
    size = 1.5, alpha = .5,
    data = route_df, lineend = "round"
  ) +
  geom_path(
    aes(x = lon, y = lat),  colour = "blue",
    size = 1.5, alpha = .5,
    data = trek_df, lineend = "round"
  )

qmap("college station, texas", zoom = 6) +
  geom_path(
    aes(x = lon, y = lat), colour = "red", size = 1.5,
    data = route_df, lineend = "round"
  )

## End(Not run)
```

`theme_inset` *Make a ggplot2 inset theme.*

Description

theme_inset is a ggplot2 theme geared towards making inset plots.

Usage

```
theme_inset(base_size = 12)
```

Arguments

`base_size`	base size, not used.

Value

a ggplot2 theme (i.e., a list of class options).

Author(s)

David Kahle <david@kahle.io>

Examples

```
library(ggplot2)
## Not run:

n <- 50
df <- expand.grid(x = 1:n,y = 1:n)[sample(n^2,.5*n^2),]
qplot(x, y, data = df, geom = 'tile')
qplot(x, y, data = df, geom = 'tile') + theme_nothing()

qplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10)),
    8, Inf, -Inf, 2
  )

qplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10) + theme_nothing()),
    8, Inf, -Inf, 2
  )

qplot(1:10, 1:10) +
  annotation_custom(
    grob = ggplotGrob(qplot(1:10,1:10) + theme_inset()),
    8, Inf, -Inf, 2
  )

## End(Not run)
```

`theme_nothing` *Make a blank ggplot2 theme.*

Description

theme_nothing simply strips all thematic element in ggplot2.

Usage

```
theme_nothing(base_size = 12, legend = FALSE)
```

Arguments

`base_size`	base size, not used.
`legend`	should the legend be included?

Value

a ggplot2 theme (i.e., a list of class options).

Author(s)

David Kahle <david@kahle.io>

Examples

```
# no legend example
n <- 50
df <- expand.grid(x = 1:n,y = 1:n)[sample(n^2,.5*n^2),]
p <- ggplot(df, aes(x, y)) + geom_raster()
p
p + theme_nothing()
p + theme_nothing(legend = TRUE) # no difference
p +
  scale_x_continuous(expand = c(0,0)) +
  scale_y_continuous(expand = c(0,0)) +
  theme_nothing()

# legend example
df$class <- factor(sample(0:1, .5*n^2,  replace = TRUE))
p <- ggplot(df, aes(x, y)) + geom_raster(aes(fill = class))
p
p + theme_nothing()
p + theme_nothing(legend = TRUE)

p <- p +
  scale_x_continuous(expand = c(0,0)) +
  scale_y_continuous(expand = c(0,0))
p
p + theme_nothing()
p + theme_nothing(legend = TRUE)
```

---

trek *Grab a trek from Google*

Description

Sequence treks (latitude-longitude sequences following ordinary paths, e.g. roads) between two locations using the Google Directions API. Note: To use Google's Directions API, you must first enable the API in the Google Cloud Platform Console. See register_google().

Usage

```
trek(
  from,
  to,
  mode = c("driving", "walking", "bicycling", "transit"),
  output = c("simple", "all"),
  alternatives = FALSE,
  units = "metric",
  urlonly = FALSE,
  override_limit = FALSE,
  ext = "com",
  inject = "",
  ...
)
```

Arguments

from	name of origin addresses in a data frame
to	name of destination addresses in a data frame
mode	driving, bicycling, walking, or transit
output	amount of output ("simple" or "all")
alternatives	should more than one route be provided?
units	"metric"
urlonly	return only the url?
override_limit	override the current query count
ext	domain extension (e.g. "com", "co.nz")
inject	character string to add to the url
...	...

Value

a tibble

## End(Not run)
```

`wind` *Wind data from Hurricane Ike*

Description

Wind data from Hurricane Ike

Details

Powell, M. D., S. H. Houston, L. R. Amat, and N Morisseau-Leroy, 1998: The HRD real-time hurricane wind analysis system. J. Wind Engineer. and Indust. Aerodyn. 77&78, 53-64

Author(s)

Atlantic Oceanographic and Meteorological Laboratory (AOML), a division of the National Oceanic and Atmospheric Administration (NOAA)

References

https://www.aoml.noaa.gov/hrd/Storm_pages/ike2008/wind.html

`XY2LonLat` *Convert a tile coordinate to a lon/lat coordinate*

Description

Convert a tile coordinate to a lon/lat coordinate for a given zoom. Decimal tile coordinates are accepted.

Usage

```
XY2LonLat(X, Y, zoom, x = 0, y = 0, xpix = 255, ypix = 255)
```

Arguments

X	horizontal map-tile coordinate (0 is map-left)
Y	vertical map-tile coordinate (0 is map-top)
zoom	zoom
x	within tile x (0 is tile-left)
y	within tile y (0 it tile-top)
xpix	width of tile in pixels
ypix	length of tile in pixels

Value

a data frame with columns lon and lat (in degrees)

Author(s)

David Kahle <david@kahle.io>, based on RgoogleMaps::XY2LatLon() by Markus Loecher of Sense Networks <markus@sensenetworks.com>

See Also

https://wiki.openstreetmap.org/wiki/Slippy_map_tilenames

Examples

```
## Not run:
XY2LonLat(480, 845, zoom = 11)
XY2LonLat(0, 0, zoom = 1)
XY2LonLat(0, 0, 255, 255, zoom = 1)
XY2LonLat(0, 0, 255, 255, zoom = 1)

## End(Not run)
```
